

Stability of Minkowski Space-time with a translation space-like Killing field

Cécile Huneau

November 24, 2015

Abstract

In this paper we prove the nonlinear stability of Minkowski space-time with a translation Killing field. In the presence of such a symmetry, the $3 + 1$ vacuum Einstein equations reduce to the $2 + 1$ Einstein equations with a scalar field. We work in generalised wave coordinates. In this gauge Einstein equations can be written as a system of quasilinear quadratic wave equations. The main difficulty in this paper is due to the decay in $\frac{1}{\sqrt{t}}$ of free solutions to the wave equation in 2 dimensions, which is weaker than in 3 dimensions. This weak decay seems to be a deterrent for proving a stability result in the usual wave coordinates. In this paper we construct a suitable generalized wave gauge in which our system has a "cubic weak null structure", which allows for the proof of global existence.

1 Introduction

In this paper, we address the stability of the Minkowski solution to the Einstein vacuum equations with a translation space-like Killing field. More precisely, we look for solutions of the $3 + 1$ vacuum Einstein equations, on manifolds of the form $\Sigma \times \mathbb{R}_{x_3} \times \mathbb{R}_t$, where Σ is a 2 dimensional manifold, equipped with a metric of the form

$$g = e^{-2\phi} g + e^{2\phi} (dx^3)^2,$$

where ϕ is a scalar function, and g a Lorentzian metric on $\Sigma \times \mathbb{R}$, all quantities being independent of x^3 . For these metrics, Einstein vacuum equations are equivalent to the $2 + 1$ dimensional system

$$\begin{cases} \square_g \phi = 0 \\ R_{\mu\nu} = 2\partial_\mu \phi \partial_\nu \phi, \end{cases} \quad (1.1)$$

where $R_{\mu\nu}$ is the Ricci tensor associated to g . Choquet-Bruhat and Moncrief studied the case where Σ is compact of genus $G \geq 2$. In [7], they proved the stability of a particular expanding solution. In this paper we work in the case $\Sigma = \mathbb{R}^2$. A particular solution is then given by Minkowski solution itself. It corresponds to $\phi = 0$ and $g = m$ equals to the Minkowski metric in dimension $2 + 1$. A natural question one can ask in this setting is the nonlinear stability of this solution.

In the $3+1$ vacuum case, the stability of Minkowski space-time has been proven in the celebrated work of Christodoulou and Klainerman [8] in a maximal foliation. It has then been proven by Lindblad and Rodnianski using wave coordinates in [22]. Their proof extends also to Einstein equations coupled to a scalar field. Let us note that the perturbations of Minkowski solution considered in our paper are not asymptotically flat in $3 + 1$ dimension, due to the presence of a translation Killing field. Consequently they are not included in [8] and [22].

In [13] we already proved quasistability of the solution $(\phi = 0, g = m)$: the perturbed solutions exist in exponential time. In both [13] and this paper, we work in generalized wave coordinates. Consequently the method we use is more in the spirit of [22] than [8].

1.1 Einstein equations in wave coordinates

Wave coordinates (x^α) are required to satisfy $\square_g x^\alpha = 0$. In these coordinates (1.1) reduces to the following system of quasilinear wave equations

$$\begin{cases} \square_g \phi = 0, \\ \square_g g_{\mu\nu} = -4\partial_\mu \phi \partial_\nu \phi + P_{\mu\nu}(\partial g, \partial g), \end{cases} \quad (1.2)$$

where $P_{\mu\nu}$ is a quadratic form. To understand the difficulty, let us first recall known results in $3+1$ dimensions. In $3+1$ dimensions, a semi linear system of wave equations of the form

$$\square u^i = P^i(\partial u^j, \partial u^k)$$

is critical in the sense that if there isn't enough structure, the solutions might blow up in finite time (see the counter examples by John [14]). However, if the right-hand side satisfies the null condition, introduced by Klainerman in [15], the system admits global solutions. This condition requires that P^i be linear combinations of the following forms

$$Q_0(u, v) = \partial_t u \partial_t v - \nabla u \cdot \nabla v, \quad Q_{\alpha\beta}(u, v) = \partial_\alpha u \partial_\beta v - \partial_\alpha v \partial_\beta u.$$

In $3+1$ dimensions, Einstein equations written in wave coordinates do not satisfy the null condition. However, this is not a necessary condition to obtain global existence. An example is provided by the system

$$\begin{cases} \square \phi_1 = 0, \\ \square \phi_2 = (\partial_t \phi_1)^2. \end{cases} \quad (1.3)$$

The non-linearity does not have the null structure, but thanks to the decoupling there is nevertheless global existence. In [21], Lindblad and Rodnianski showed that the non linear terms in Einstein equations in wave coordinates consist of a linear combination of null forms with an underlying structure of the form (1.3). They used the wave condition to obtain better decay for some coefficients of the metric. However the decay is slower than for the solution of the wave equation. An example of a quasilinear scalar wave equation admitting global existence without the null condition, but with a slower decay is also studied by Lindblad in [19] in the radial case, and by Alinhac in [2] and Lindblad in [20] in the general case. In [21], Lindblad and Rodnianski introduced the notion of weak-null structure, which gathers all these examples.

In $2+1$ dimensions, to show global existence, one has to be careful with both quadratic and cubic terms. Quasilinear scalar wave equations in $3+1$ dimensions have been studied by Alinhac in [1]. He shows global existence for a quasilinear equation of the form

$$\square u = g^{\alpha\beta}(\partial u) \partial_\alpha \partial_\beta u,$$

if the quadratic and cubic terms in the right-hand side satisfy the null condition. Global existence for a semi-linear wave equation with the quadratic and cubic terms satisfying the null condition has been shown by Godin in [9] using an algebraic trick to remove the quadratic terms, which does however not extend to systems. The global existence in the case of systems of semi-linear wave equations with the null structure has been shown by Hoshiga in [10]. It requires the use of $L^\infty - L^\infty$ estimates for the inhomogeneous wave equations, introduced in [17].

To show the quasi global existence for our system in wave coordinates, it will therefore be necessary to exhibit structure in quadratic and cubic terms. However, as for the vacuum Einstein equations in $3+1$ dimension in wave coordinates, our system does not satisfy the null structure. In particular it is important to understand what happens for a system of the form (1.3) in $2+1$ dimensions. For such a system, standard estimates only give an L^∞ bound for ϕ_2 , without decay. Moreover, the growth of the energy of ϕ_2 is like \sqrt{t} .

One can easily imagine that with more intricate a coupling than for (1.3), it will be very difficult to prove stability without decay for ϕ_2 . It seems that in the usual wave gauge one cannot prove more than existence of the perturbed solutions in time $\frac{1}{\varepsilon^2}$. But it also seems that this problem is only a problem of coordinates. In [13] we overcame part of the difficulty by looking at solutions $g = g_b + \tilde{g}$ with

$$g_b = -dt^2 + dr^2 + (r + \chi(q)b(\theta)q)^2 d\theta^2,$$

where r, θ are the polar coordinate, $q = r - t$ and χ is a cut-off function such that $\chi(q) = 0$ for $q < 0$ and $\chi(q) = 1$ for $q > 1$, and $b(\theta)$ suitably chosen, depending on ϕ . We may have two complementary points of view on this method. The metric g_b can be seen as an approximate solution whose role is to tackle the worst terms in (1.1). Also, since $t, x_1 = r \cos(\theta), x_2 = r \sin(\theta)$ are not wave coordinates for g_b , this forces us to work in a different gauge, more suited to the geometry of the problem. The condition we imposed on $b(\theta)$ in [13] was

$$b(\theta) - \int_0^\infty (\partial_q \phi)^2(r, t, \theta) r dr = O\left(\frac{\varepsilon^2}{\sqrt{1+t}}\right).$$

However, due to the logarithmic growth in t of the higher energy norms of ϕ , which seems inherent to such problems, the coefficient $b(\theta)$ was controlled by restricting to exponential times.

The main idea of this paper to overcome this difficulty is to construct more carefully an approximate solution and gauge choice, noticing that in the metric g_b , the Fourier coefficients

$$\int b d\theta, \quad \int b(\theta) \cos(\theta) d\theta, \quad \int b(\theta) \sin(\theta),$$

are imposed by the constraint equations, but the remaining of $b(\theta)$ is only a gauge choice in the region $\chi = 1$.

1.2 The initial data

In this section, we will explain how to choose the initial data for ϕ and g . We will note i, j the space-like indices and α, β the space-time indices. We will work in weighted Sobolev spaces.

Definition 1.1. *Let $m \in \mathbb{N}$ and $\delta \in \mathbb{R}$. The weighted Sobolev space $H_\delta^m(\mathbb{R}^n)$ is the completion of C_0^∞ for the norm*

$$\|u\|_{H_\delta^m} = \sum_{|\beta| \leq m} \|(1 + |x|^2)^{\frac{\delta + |\beta|}{2}} D^\beta u\|_{L^2}.$$

The weighted Hölder space C_δ^m is the complete space of m -times continuously differentiable functions with norm

$$\|u\|_{C_\delta^m} = \sum_{|\beta| \leq m} \|(1 + |x|^2)^{\frac{\delta + |\beta|}{2}} D^\beta u\|_{L^\infty}.$$

Let $0 < \alpha < 1$. The Hölder space $C_\delta^{m+\alpha}$ is the the complete space of m -times continuously differentiable functions with norm

$$\|u\|_{C_\delta^{m+\alpha}} = \|u\|_{C_\delta^m} + \sup_{x \neq y, |x-y| \leq 1} \frac{|\partial^m u(x) - \partial^m u(y)| (1 + |x|^2)^{\frac{\delta}{2}}}{|x - y|^\alpha}.$$

We recall the Sobolev embedding with weights (see for example [6], Appendix I).

Proposition 1.2. *Let $s, m \in \mathbb{N}$. We assume $s > 1$. Let $\beta \leq \delta + 1$ and $0 < \alpha < \min(1, s - 1)$. Then, we have the continuous embedding*

$$H_\delta^{s+m}(\mathbb{R}^2) \subset C_\beta^{m+\alpha}(\mathbb{R}^2).$$

Let $0 < \delta < 1$. The initial data (ϕ_0, ϕ_1) for $(\phi, \partial_t \phi)|_{t=0}$ are freely given in $H_\delta^{N+1} \times H_{\delta+1}^N$ with $0 < \delta < 1$. For technical reason, we will work here with compactly supported initial data for $\phi : (\phi_0, \phi_1) \in H^{N+1}(\mathbb{R}^2) \times H^N(\mathbb{R}^2)$ supported in $B(0, R)$. The initial data for $(g_{\mu\nu}, \partial_t g_{\mu\nu})$ cannot be chosen arbitrarily, they must satisfy the constraint equations.

We recall the constraint equations. First we write the metric g in the form

$$g = -N^2(dt)^2 + \bar{g}_{ij}(dx^i + \beta^i dt)(dx^j + \beta^j dt),$$

where the scalar function N is called the lapse, the vector field β is called the shift and \bar{g} is a Riemannian metric on \mathbb{R}^2 .

We consider the initial space-like surface $\mathbb{R}^2 = \{t = 0\}$. We will use the notation

$$\partial_0 = \partial_t - \mathcal{L}_\beta,$$

where \mathcal{L}_β is the Lie derivative associated to the vector field β . With this notation, we have the following expression for the second fundamental form of \mathbb{R}^2

$$K_{ij} = -\frac{1}{2N}\partial_0 g_{ij}.$$

We will use the notation

$$\tau = g^{ij}K_{ij}$$

for the mean curvature. We also introduce the Einstein tensor

$$G_{\alpha\beta} = R_{\alpha\beta} - \frac{1}{2}Rg_{\alpha\beta},$$

where R is the scalar curvature $R = g^{\alpha\beta}R_{\alpha\beta}$. The constraint equations are given by

$$G_{0j} \equiv N(\partial_j \tau - D^i K_{ij}) = \partial_0 \phi \partial_j \phi, \quad j = 1, 2, \quad (1.4)$$

$$G_{00} \equiv \frac{N^2}{2}(\bar{R} - |K|^2 + \tau^2) = (\partial_0 \phi)^2 - \frac{1}{2}g_{00}g^{\alpha\beta}\partial_\alpha \phi \partial_\beta \phi, \quad (1.5)$$

where D and \bar{R} are respectively the covariant derivative and the scalar curvature associated to \bar{g} . We have studied the constraint equations in [11] and [12]. The following result is a direct consequence [12] which was proven in Appendix 1 of [13]. It gives us the initial data we need.

Theorem 1.3. *Let $0 < \delta < 1$. Let $(\phi_0, \phi_1) \in H_\delta^{N+1}(\mathbb{R}^2) \times H_{\delta+1}^N(\mathbb{R}^2)$ We assume*

$$\|\phi_0\|_{H_\delta^{N+1}} + \|\phi_1\|_{H_{\delta+1}^N} \lesssim \varepsilon, \quad \|\tilde{b}\|_{W^{N,2}} \lesssim \varepsilon^2.$$

If $\varepsilon > 0$ is small enough, there exists $a_0, a_1, a_2 \in \mathbb{R} \times \mathbb{R} \times \mathbb{S}^1$, $J \in W^{N,2}(\mathbb{S}^1)$ and

$$(g_{\alpha\beta})_0, (g_{\alpha\beta})_1 \in H_\delta^{N+1} \times H_{\delta+1}^N$$

such that the initial data for g given by

$$g = g_a + g_0, \quad \partial_t g = \partial_t g_a + g_1,$$

where g_a is defined by

$$g_a = -dt^2 + dr^2 + (r + \chi(q)a(\theta)q)^2 d\theta^2 + J(\theta)\chi(q)dq d\theta,$$

with

$$a(\theta) = a_0 + a_1 \cos(\theta) + a_2 \sin(\theta),$$

are such that

- $g_{ij}, K_{ij} = \mathcal{L}_\beta g_{ij}$ satisfy the constraint equations (1.4) and (1.5).
- the following generalized wave coordinates condition is satisfied at $t = 0$

$$g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha = g_a^{\lambda\beta} (\Gamma_b)_{\lambda\beta}^\alpha.$$

Moreover, we have the estimates

$$\|J\|_{W^{N,2}(\mathbb{S}^1)} + \|g_0\|_{H_\delta^{N+1}} + \|g_1\|_{H_{\delta+1}^N} \lesssim \varepsilon^2,$$

$$\begin{aligned} a_0 &= \frac{1}{4\pi} \int \left(\dot{\phi}^2 + |\nabla \phi|^2 \right) + O(\varepsilon^4), \\ a_1 &= \frac{1}{\pi} \int \dot{\phi} \partial_1 \phi + O(\varepsilon^4), \\ a_2 &= \frac{1}{\pi} \int \dot{\phi} \partial_2 \phi + O(\varepsilon^4). \end{aligned}$$

Before stating our main result, we will recall some notations and basic tools in the study of wave equations.

1.3 Some basic tools

Coordinates and frames

- We note x^α the standard space-time coordinates, with $t = x^0$. We note (r, θ) the polar space-like coordinates, and $s = t + r$, $q = r - t$ the null coordinates. The associated one-forms are

$$ds = dt + dr, \quad dq = dr - dt,$$

and the associated vector fields are

$$\partial_s = \frac{1}{2}(\partial_t + \partial_r), \quad \partial_q = \frac{1}{2}(\partial_r - \partial_t).$$

- We note ∂ the space-time derivatives, ∇ the space-like derivatives, and by $\bar{\partial}$ the derivatives tangent to the future directed light-cone in Minkowski, that is to say $\partial_t + \partial_r$ and $\frac{\partial_\theta}{r}$.
- We introduce the null frame $L = \partial_t + \partial_r$, $\underline{L} = \partial_t - \partial_r$, $U = \frac{\partial_\theta}{r}$. In this frame, the Minkowski metric takes the form

$$m_{L\underline{L}} = -2, \quad m_{UU} = 1, \quad m_{LL} = m_{\underline{L}\underline{L}} = m_{LU} = m_{\underline{L}U} = 0.$$

The collection $\mathcal{T} = \{U, L\}$ denotes the vector fields of the frame tangent to the light-cone, and the collection $\mathcal{V} = \{U, L, \underline{L}\}$ denotes the full null frame.

The flat wave equation Let ϕ be a solution of

$$\begin{cases} \square \phi = 0, \\ (\phi, \partial_t \phi)|_{t=0} = (\phi_0, \phi_1). \end{cases} \quad (1.6)$$

The following proposition establishes decay for the solutions of 2+1 dimensional flat wave equation.

Proposition 1.4 (Proposition 2.1 in [18]). *Let $\mu > \frac{1}{2}$. We have the estimate*

$$|\phi(x, t)| \lesssim M_\mu(\phi_0, \phi_1) \frac{(1 + |t - r|)^{[1-\mu]_+}}{\sqrt{1+t+r}\sqrt{1+|t-r|}}$$

where

$$M_\mu(\phi_0, \phi_1) = \sup_{y \in \mathbb{R}^2} (1 + |y|)^\mu |\phi_0(y)| + (1 + |y|)^{\mu+1} (|\phi_1(y)| + |\nabla \phi_0(y)|)$$

and where we used the notation $A^{[\alpha]_+} = A^{\max(\alpha, 0)}$ if $\alpha \neq 0$ and $A^{[0]_+} = \ln(A)$.

Minkowski vector fields We will rely in a crucial way on the Klainerman vector field method. We introduce the following family of vector fields

$$\mathcal{Z} = \{\partial_\alpha, \Omega_{\alpha\beta} = -x_\alpha \partial_\beta + x_\beta \partial_\alpha, S = t\partial_t + r\partial_r\},$$

where $x_\alpha = m_{\alpha\beta} x^\beta$. These vector fields satisfy the commutation property

$$[\square, Z] = C(Z)\square,$$

where

$$C(Z) = 0, \quad Z \neq S, \quad C(S) = 2.$$

Moreover some easy calculations give

$$\begin{aligned} \partial_t + \partial_r &= \frac{S + \cos(\theta)\Omega_{0,1} + \sin(\theta)\Omega_{0,2}}{t+r}, \\ \frac{1}{r}\partial_\theta &= \frac{\Omega_{1,2}}{r} = \frac{\cos(\theta)\Omega_{0,2} - \sin(\theta)\Omega_{0,1}}{t}, \\ \partial_t - \partial_r &= \frac{S - \cos(\theta)\Omega_{0,1} - \sin(\theta)\Omega_{0,2}}{t-r}. \end{aligned}$$

With this calculations, and the commutations properties in the region $-\frac{t}{2} \leq r \leq 2t$

$$[Z, \partial] \sim \partial, \quad [Z, \bar{\partial}] \sim \bar{\partial},$$

we obtain

$$|\partial^k \bar{\partial}^l u| \leq \frac{1}{(1+|q|)^k (1+s)^l} |Z^{k+l} u|, \tag{1.7}$$

where here and in the rest of the paper, $Z^I u$ denotes any product of I or less of the vector fields of \mathcal{Z} . Estimates (1.7) and Proposition 1.4 yield

Corollary 1.5. *Let ϕ be a solution of (1.6). We have the estimate*

$$|\partial^k \bar{\partial}^l \phi(x, t)| \lesssim M_\mu^{k+l}(\phi_0, \phi_1) \frac{(1 + |t - r|)^{[1-\mu]_+}}{(1+t+r)^{l+\frac{1}{2}} (1+|t-r|)^{k+\frac{1}{2}}}$$

where

$$M_\mu^j(\phi_0, \phi_1) = \sup_{y \in \mathbb{R}^2} (1 + |y|)^{\mu+j} |\nabla^s \phi_0(y)| + (1 + |y|)^{\mu+1+j} (|\nabla^s \phi_1(y)| + |\nabla^{1+j} \phi_0(y)|).$$

Weighted energy estimate We consider a weight function $w(q)$, where $q = r - t$, such that $w'(q) > 0$ and

$$\frac{w(q)}{(1 + |q|)^{1+\mu}} \lesssim w'(q) \lesssim \frac{w(q)}{1 + |q|},$$

for some $0 < \mu < \frac{1}{2}$.

Proposition 1.6. *We assume that $\square\phi = f$. Then we have*

$$\begin{aligned} & \frac{1}{2} \partial_t \int w(q) ((\partial_t \phi)^2 + |\nabla \phi|^2) + \frac{1}{2} \int w'(q) \left((\partial_s \phi)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) \\ & \lesssim \int w(q) |f \partial_t \phi|. \end{aligned}$$

For the proof of Proposition 1.6, we refer to the proof of Proposition 8.2.

Weighted Klainerman-Sobolev inequality The following proposition allows us to obtain L^∞ estimates from the energy estimates. It is proved in Appendix 5 of [13]. The proof is inspired from the corresponding $3 + 1$ dimensional proposition (Proposition 14.1 in [22]).

Proposition 1.7. *We denote by v any of our weight functions. We have the inequality*

$$|f(t, x) v^{\frac{1}{2}}(|x| - t)| \lesssim \frac{1}{\sqrt{1 + t + |x|} \sqrt{1 + ||x| - t|}} \sum_{|I| \leq 2} \|v^{\frac{1}{2}}(\cdot - t) Z^I f\|_{L^2}.$$

Weighted Hardy inequality If u is solution of $\square u = f$, the energy estimate allows us to estimate the L^2 norm of ∂u . To estimate the L^2 norm of u , we will use a weighted Hardy inequality.

Proposition 1.8. *Let $\alpha < 1$ and $\beta > 1$. We have, with $q = r - t$*

$$\left\| \frac{v(q)^{\frac{1}{2}}}{(1 + |q|)} f \right\|_{L^2} \lesssim \|v(q)^{\frac{1}{2}} \partial_r f\|_{L^2},$$

where

$$\begin{aligned} v(q) &= (1 + |q|)^\alpha, \text{ for } q < 0, \\ v(q) &= (1 + |q|)^\beta, \text{ for } q > 0. \end{aligned}$$

This is proven in Appendix 4 of [13]. The proof is inspired from the $3 + 1$ dimensional analogue (Lemma 13.1 in [22]).

$L^\infty - L^\infty$ estimate With the condition $w'(q) > 0$ for the energy inequality, we are not allowed to take weights of the form $(1 + |q|)^\alpha$, with $\alpha > 0$ in the region $q < 0$. Therefore, Klainerman-Sobolev inequality cannot give us more than the estimate

$$|\partial u| \lesssim \frac{1}{\sqrt{1 + |q|} \sqrt{1 + s}},$$

in the region $q < 0$, for a solution of $\square u = f$. However, we know that for suitable initial data, the solution of the wave equation $\square u = 0$ satisfies

$$|u| \lesssim \frac{1}{\sqrt{1 + |q|} \sqrt{1 + s}}, \quad |\partial u| \lesssim \frac{1}{(1 + |q|)^{\frac{3}{2}} \sqrt{1 + s}}.$$

To recover some of this decay we will use the following proposition

Proposition 1.9. *Let u be a solution of*

$$\begin{cases} \square u = F, \\ (u, \partial_t u)|_{t=0} = (0, 0). \end{cases}$$

For $\mu > \frac{3}{2}, \nu > 1$ we have the following $L^\infty - L^\infty$ estimate

$$|u(t, x)|(1 + t + |x|)^{\frac{1}{2}} \leq C(\mu, \nu) M_{\mu, \nu}(F)(1 + |t - |x|||)^{-\frac{1}{2} + [2 - \mu]_+},$$

where

$$M_{\mu, \nu}(F) = \sup(1 + |y| + s)^\mu (1 + |s - |y||)^\nu F(y, s),$$

and where we used the convention $A^{[\alpha]_+} = A^{\max(\alpha, 0)}$ if $\alpha \neq 0$ and $A^{[0]_+} = \ln(A)$.

This is proven in Appendix 3 of [13]. This inequality has been introduced by Kubo and Kubota in [17].

An integration lemma The following lemma will be used many times in the proof of Theorem 1.12, to obtain estimates for u when we only have estimates for ∂u .

Lemma 1.10. *Let $\alpha, \beta, \gamma \in \mathbb{R}$ with $\beta < -1$. We assume that the function $u : \mathbb{R}^{2+1} \rightarrow \mathbb{R}$ satisfies*

$$|\partial u| \lesssim (1 + s)^\gamma (1 + |q|)^\alpha, \text{ for } q < 0, \quad |\partial u| \lesssim (1 + s)^\gamma (1 + |q|)^\beta \text{ for } q > 0,$$

and for $t = 0$

$$|u| \lesssim (1 + r)^{\gamma + \beta}.$$

Then we have the following estimates

$$|u| \lesssim (1 + s)^\gamma \max(1, (1 + |q|)^{\alpha+1}), \text{ for } q < 0, \quad |u| \lesssim (1 + s)^\gamma (1 + |q|)^{\beta+1} \text{ for } q > 0.$$

Proof. We assume first $q > 0$. We integrate the estimate

$$|\partial_q u| \lesssim (1 + s)^\gamma (1 + |q|)^\beta,$$

from $t = 0$. We obtain, since $\beta < -1$, for $q > 0$

$$|u| \lesssim (1 + s)^\gamma (1 + |q|)^{\beta+1}.$$

Consequently, we have, for $q = 0$, $|u| \lesssim (1 + s)^\gamma$. We now assume $q < 0$. We integrate

$$|\partial_q u| \lesssim (1 + s)^\gamma (1 + |q|)^\alpha,$$

from $q = 0$. We obtain

$$|u| \lesssim (1 + s)^\gamma \max(1, (1 + |q|)^{\alpha+1}).$$

This concludes the proof of Lemma 1.10. □

Generalized wave coordinates In a coordinate system x^α , the Ricci tensor is given by

$$R_{\mu\nu} = -\frac{1}{2}g^{\alpha\rho}\partial_\alpha\partial_\rho g_{\mu\nu} + \frac{1}{2}H^\rho\partial_\rho g_{\mu\nu} + \frac{1}{2}(g_{\mu\rho}\partial_\nu H^\rho + g_{\nu\rho}\partial_\mu H^\rho) + \frac{1}{2}P_{\mu\nu}(g)(\partial g, \partial g), \quad (1.8)$$

where $P_{\mu\nu}(g)(\partial g, \partial g)$ is a quadratic form in ∂g and

$$H^\alpha = \square_g x^\alpha = -\partial_\lambda g^{\lambda\alpha} - \frac{1}{2}g^{\lambda\mu}\partial^\alpha g_{\lambda\mu}. \quad (1.9)$$

The wave coordinate condition (respectively the generalized wave coordinate condition) consists in imposing $H^\alpha = 0$ (respectively $H^\alpha = F^\alpha$ a fixed function, which may depend on g but not on its derivatives).

Proposition 1.11. *If the coupled system of equations*

$$\begin{cases} -\frac{1}{2}g^{\alpha\rho}\partial_\alpha\partial_\rho g_{\mu\nu} + \frac{1}{2}F^\rho\partial_\rho g_{\mu\nu} + \frac{1}{2}(g_{\mu\rho}\partial_\nu F^\rho + g_{\nu\rho}\partial_\mu F^\rho) + \frac{1}{2}P_{\mu\nu}(g)(\partial g, \partial g) = 2\partial_\mu\phi\partial_\nu\phi \\ g^{\alpha\rho}\partial_\alpha\partial_\rho\phi - F^\rho\partial_\rho\phi = 0 \end{cases} \quad (1.10)$$

with F a function which may depend on ϕ, g , is satisfied on a time interval $[0, T]$ with $T > 0$, if the initial induced Riemannian metric and second fundamental form (\bar{g}, K) satisfy the constraint equations, and if the initial compatibility condition

$$F^\alpha|_{t=0} = H^\alpha|_{t=0}, \quad (1.11)$$

is satisfied, then the equations (1.1) are satisfied on $[0, T]$, together with the wave coordinate condition

$$F^\alpha = H^\alpha.$$

For a proof of this result, we refer to [23], or Appendix 2 of [13].

1.4 Main Result

We introduce an other cut-off function $\Upsilon : \mathbb{R}_+ \rightarrow \mathbb{R}_+$ such that $\Upsilon(\rho) = 0$ for $\rho \leq \frac{1}{2}$ and $\rho \geq 2$ and $\Upsilon = 1$ for $\frac{3}{4} \leq \rho \leq \frac{3}{2}$. Theorem 1.12 is our main result, in which we prove stability of Minkowski space-time with a translational symmetry. We give here a first version, a more precise one will be given in Section 2.4.

Theorem 1.12. *Let $0 < \varepsilon < 1$. Let $\frac{1}{2} < \delta < 1$ and $N \geq 40$. Let $(\phi_0, \phi_1) \in H^{N+2}(\mathbb{R}^2) \times H^{N+1}(\mathbb{R}^2)$ compactly supported in $B(0, R)$. We assume*

$$\|\phi_0\|_{H^{N+2}} + \|\phi_1\|_{H^{N+1}} \leq \varepsilon.$$

Let $\varepsilon \ll \rho \ll \sigma \ll \delta$, such that $\delta - 2\sigma > \frac{1}{2}$. If ε is small enough, there exists a global solution (g, ϕ) of (1.1). Moreover, if we call C the causal future of $B(0, R)$, and \bar{C} its complement, there exists a coordinate system (t, x_1, x_2) in C and a coordinate system (t', x'_1, x'_2) in \bar{C} such that we have in C :

$$(\phi, \partial_t \phi)|_{t=0} = (\phi_0, \phi_1),$$

$$|g - m| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}}, \quad |\phi| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{1}{2}-4\rho}},$$

$$\|\mathbb{1}_C \partial Z^N \phi\|_{L^2} + \|\mathbb{1}_C \partial^2 Z^N \phi\|_{L^2} + \|\mathbb{1}_C (1+|q|)^{-\frac{1}{2}-\sigma} \partial Z^N (g-m)\|_{L^2} \lesssim \varepsilon(1+t)^{2\rho},$$

and we have in \bar{C}

$$\|\mathbb{1}_{\bar{C}} (1+|q|)^{1+\delta-2\sigma} \partial Z^N (g-g_a)\|_{L^2} \lesssim \varepsilon(1+t)^{2\rho}.$$

Comments on Theorem 1.12

- We consider perturbations of $3 + 1$ dimensional Minkowski space-time with a translational space-like Killing field. These perturbations are not asymptotically flat in $3 + 1$ dimensions, therefore the result of Theorem 1.12 does not follow from the stability of Minkowski space-time by Christodoulou and Klainerman [8].
- As our gauge, we choose the generalized wave coordinates. Therefore, the method we use has a lot in common with the method of Lindblad and Rodnianski in [22] where they proved the stability of Minkowski space-time in harmonic gauge. It is an interesting problem to investigate the stability of Minkowski with a translation symmetry using a strategy in the spirit of [8] or [16].
- Theorem 1.12 can be easily generalized to the non polarized case, where the $3 + 1$ dimensional metric is of the form

$$\mathbf{g} = e^{-2\phi}g + e^{2\phi}(dx^3 + A_\alpha dx^\alpha)^2.$$

In this case, the vacuum Einstein equation reduce to Einstein equations coupled to a wave-map system in $2 + 1$ dimension. Since the additional equations have the null structure, this does not make any change to the proof given here.

- It is conjectured that maximal Cauchy developments of asymptotically flat solutions to the $3+1$ vacuum Einstein equations with a spacelike translational Killing field are geodesically complete (see [3]). This result has been proved in the non polarized case with an additional symmetry assumption in [3].
- We assume more regularity for ϕ than for g . This is possible in wave coordinates because the equation $\square_g \phi = 0$ involves only g and not its derivatives. The proof is based on the construction of an approximate solution in the exterior region, and it is for the control of this approximate solution, which involves one derivative of ϕ that the additional regularity for ϕ is needed.
- Our proof restrict to ϕ compactly supported. The reason why is the following. Our approximate solution forces us to work in adapted generalized wave coordinates in the exterior. The approximate solution involves one derivatives of ϕ , so if ϕ was not supported only in the interior, the equation $\square_g \phi = 0$ would involve coupling terms between ϕ and the approximate solution, at the level of two derivatives of ϕ . Let us note that in [13], the compact support assumption for ϕ is not needed.
- The space-time constructed in Theorem 1.12 is the development of the initial data of Theorem 1.3. At space-like infinity, the metric converges to g_a given by the constraint equations. The metric g_a is Ricci flat in the exterior and has a deficit angle. This behaviour is similar to the behaviour of Einstein-Rosen waves (see [5] and [4]) which are radial solution of (1.1).

1.5 Sketch of the proof

To begin with, let us look at the structure of Einstein equations in wave coordinates. The structure of Einstein equations can be seen when we write them in the null frame L, \underline{L}, U . We decompose the metric into

$$g = m + \tilde{g} + \frac{1}{4}g_{\underline{L}\underline{L}}dq^2,$$

where m is the Minkowski metric. Then, if we neglect all the nonlinearities involving a good derivative, we obtain the following model system for (1.1) in wave coordinates

$$\begin{cases} \square\phi + g_{LL}\partial_q^2\phi = 0, \\ \square\tilde{g} + g_{LL}\partial_q^2\tilde{g} = 0, \\ \square g_{LL} + g_{LL}\partial_q^2 g_{LL} = -16(\partial_q\phi)^2. \end{cases}$$

The quadratic terms involving g_{LL} are handled by making use of the wave coordinate condition, as in [22] : the condition $H^\alpha = 0$ where H^α is defined by (1.9) implies $\partial_q g_{LL} \sim \bar{\partial}\tilde{g}$. Therefore, the quadratic terms involving g_{LL} behave like terms having the null structure. Consequently, we are left with the model system

$$\begin{cases} \square\phi = 0, \\ \square g_{LL} = -4(\partial_q\phi)^2. \end{cases}$$

Thanks to the decoupling it is of course possible to solve such a system. However, in $2 + 1$ dimensions, for initial data of size ε the energy estimate yields

$$\|\partial g_{LL}\|_{L^2} \lesssim \varepsilon\sqrt{1+t},$$

and the metric coefficient g_{LL} has no decay, not even with respect to $q = r - t$. This is not enough to solve the full coupled system. However, this seems to be only a coordinate problem. To see it, let's assume for a moment we had found a coordinate system (not the wave gauge) in which all the metric coefficients have at least the decay of a solution to the free wave equation. Then we can compute, on the light cone

$$R_{LL} = -2\partial_q^2 g_{UU} + O\left(\frac{\varepsilon}{(1+r)^{\frac{3}{2}}}\right).$$

Since we also have

$$R_{LL} = (\partial_q\phi)^2 = O\left(\frac{\varepsilon}{1+r}\right),$$

we see that the only term which could balance this behaviour is $\partial_q^2 g_{UU}$. Consequently, we would like to write

$$\partial_q g_{UU} = \frac{4}{r} \int (\partial_q\phi)^2 r dq + \partial_q \tilde{g}_{UU}.$$

We can impose to have such a decomposition in C , the causal future of $B(0, R)$, by choosing to work in generalized wave coordinates such that

$$H^L = L_\alpha \square_g x^\alpha = \frac{2}{r} \int_{-\infty}^q (\partial_q\phi)^2 r dq. \quad (1.12)$$

Indeed, we will see in Section 4 that $L_\alpha \square_g x^\alpha \sim \frac{1}{2}\partial_q g_{UU} + \bar{\partial}g$. With this gauge, a model equation for g_{LL} will be

$$\square g_{LL} = -16(\partial_q\phi)^2 + 2g_{LL}\partial_{\underline{L}}H^L \sim 4\tilde{g}_{LL}(\partial_q\phi)^2.$$

In the right-hand side, instead of having a quadratic nonlinearity without null structure, we now have a cubic nonlinearity without null structure. This leads to a logarithmic loss in the estimate for g_{LL} but as in [22], this loss occurs only on "bad" coefficients. Thanks to the structure, "bad" components of the metric interact only with good derivatives. Consequently, this is not an obstruction for proving global existence.

Let us analyse the consequence of 1.12 in the exterior region. Since the initial data for ϕ are compactly supported, outside the causal future of this compact region, we obtain

$$\partial_q g_{UU} = \frac{1}{r}a(\theta, s) + \partial_q \tilde{g}_{UU},$$

and consequently

$$g_{UU} \sim \frac{q}{r} a(\theta, s).$$

We can compute that the metric

$$-dt^2 + dr^2 + (r + qa(\theta, s))^2 d\theta^2,$$

is not Ricci flat when a depend on s . However outside the causal future of $B(0, R)$ we have $R_{\mu\nu} = \partial_\mu \phi \partial_\nu \phi = 0$.

To overcome this difficulty we will follow the following scheme.

- The initial data for ϕ are given, compactly supported in $B(0, R)$. The initial data for g are given by Theorem 1.3. At the level of the initial data, we can write $g = g_a + \tilde{g}$, with

$$\begin{aligned} g_a &= -(dt')^2 + (dr')^2 + (r' + \chi(q')a(\theta')q')^2 (d\theta')^2 + J(\theta')\chi(q')dq'd\theta', \\ a(\theta') &= a_0 + a_1 \cos(\theta') + a_2 \sin(\theta'), \\ a_0 &= \frac{1}{4\pi} \int (\dot{\phi}^2 + |\nabla \phi|^2) + O(\varepsilon^4), \\ a_1 &= \frac{1}{\pi} \int \dot{\phi} \partial_1 \phi + O(\varepsilon^4), \\ a_2 &= \frac{1}{\pi} \int \dot{\phi} \partial_2 \phi + O(\varepsilon^4), \end{aligned}$$

and $(\tilde{g}, \partial_t \tilde{g})|_{t=0} \in H_\delta^{N+1} \times H_{\delta+1}^N$ for all $0 < \delta < 1$.

- We can solve (1.1) in generalised wave coordinates $\square_g x^{(\alpha)} = \square_{g_a} x^{(\alpha)}$ up to a time T . We obtain a solution of the form $g = g_a + \tilde{g}$. Moreover the solution is global outside the domain of dependence of $B(0, R)$ (see Appendix A).
- We consider a function $b(\theta, s)$, satisfying a set of hypothesis H , and make a change of variable in the region $q > R + 1$

$$\begin{aligned} s' &\sim (1 + b(\theta, s))s, \\ q' &\sim (1 + b(\theta, s))^{-1}q, \\ \theta' &\sim \theta + f(\theta, s), \end{aligned}$$

where $f(\theta, s)$ is such that

$$1 + \partial_\theta f(\theta, s) = (1 + b(\theta, s))^{-1}.$$

We use the symbol \sim because we prefer to give a simplified formula at this stage, to enlighten the main contributions. The precise formula is given in next section. With this change of variable, we obtain a solution of the form $g = g_b + \tilde{g}$, where in the region $q > R + 1$, the metric g_b corresponds to g_a , expressed in the new coordinates q, s, θ . By construction g_b is Ricci flat for $q > R + 1$ and it is given by

$$g_b \sim -dt^2 + dr^2 + (r + \chi(q)(a(\theta) - b(\theta, s) - \partial_\theta^2 b(\theta, s))q)^2 d\theta^2,$$

where we have neglected the terms involving $\partial_s b$. By looking at the Riemannian metric induced by g on the new hypersurface $t = 0$ and at the second fundamental form, we obtain solution of the constraint equations with an asymptotic behaviour compatible with g_b . (see Appendix B).

- We now perform a bootstrap argument. We assume that we have a solution (g, ϕ) on a time interval $[0, T']$ in generalized coordinates such that in the exterior $\square_g x^\alpha \sim \square_{g_b} x^\alpha$ (plus corrective terms) and in the interior we have (1.12) (plus corrective terms). We assume that we can write $g = g_b + \tilde{g}$, with \tilde{g} satisfying estimates similar to the estimates for a free wave (except for \tilde{g}_{LL} which has a logarithmic growth in the energy). We note

$$h(\theta, t) = a(\theta) + b(\theta, t) + \partial_\theta^2 b(\theta, t).$$

In the bootstrap assumptions we also assume that

$$\Pi \left(\int_0^\infty (\partial_q \phi(t, r, \theta))^2 r dr - h(\theta, t) \right) = O \left(\frac{\varepsilon^2}{\sqrt{1+t}} \right), \quad (1.13)$$

where $\Pi : H^k(\mathbb{S}^1) \rightarrow H^k(\mathbb{S}^1)$ is the projection operator such that

$$\int \Pi(u) d\theta = \int \Pi(u) \cos(\theta) d\theta = \int \Pi(u) \sin(\theta) d\theta = 0.$$

- By integrating the constraint equations on a time slab t constant, we obtain the remaining estimate for h

$$\int_0^\infty (\partial_q \phi(t, r, \theta))^2 r dr - h(\theta, t) = O \left(\frac{\varepsilon^2}{\sqrt{1+t}} \right).$$

- We obtain estimates for \tilde{g} and ϕ thanks to $L^\infty - L^\infty$ estimates and energy estimates. This step follows a quite standard vector field method, similar to the one in [22]. Let us just note that, as in [13], we have to introduce a set of weight functions to be able to use the structure of our equations even at the level of our last energy estimate. We describe briefly this issue in section 1.6. We also use the set of weight functions to treat the interaction with the metric g_b .
- To improve estimate (1.13), we set

$$h^{(2)}(\theta, t) \sim 2 \int_0^\infty (\partial_q \phi(t, r, \theta))^2 r dr,$$

and choose $b^{(2)}$ to be the solution to the elliptic equation

$$b^{(2)} + \partial_\theta^2 b^{(2)} = \Pi h^{(2)}.$$

We then check that $b^{(2)}$ satisfies the estimates H (for this purpose, some geometric corrective terms have to be added to the formula given here for $h^{(2)}$), return to the third step to construct initial data with the asymptotic behaviour given by $g_{b(2)}$, and solve the evolution problem in coordinates adapted to $g_{b(2)}$, we note $(g^{(2)}, \phi^{(2)})$ the solution. We remark that we can go from one solution to the other by a change of coordinates, which can be controlled thanks to the estimates we have on the metric. Consequently $(g^{(2)}, \phi^{(2)})$ satisfy the same improved estimates as (g, ϕ) and moreover, we have improved (1.12).

- By performing an inverse change of variable in \tilde{C} we see that g converges to g_a in the exterior, which is the behaviour given in Theorem 1.12.

1.6 Non commutation of the null decomposition with the wave operator

We have seen in the previous section that the coefficient g_{LL} is expected to have a logarithmic growth in the energy

$$\|w^{\frac{1}{2}}\partial g_{LL}\|_{L^2} \lesssim \varepsilon^2(1+t)^\rho.$$

We do not want this behaviour to propagate to the other coefficients of the metric. To this end, we will rely on a decomposition of the type

$$g = g_b + \Upsilon\left(\frac{r}{t}\right) \frac{g_{LL}}{4} dq^2 + \tilde{g}_1.$$

However, since the wave operator does not commute with the null decomposition, we have to control the solution \tilde{g}_1 of an equation of the form (see the proof of Corollary 9.4)

$$\square \tilde{g}_1 = \Upsilon\left(\frac{r}{t}\right) \frac{\bar{\partial} g_{LL}}{r}.$$

When applying the weighted energy estimate for \tilde{g}_1 , we obtain

$$\frac{d}{dt} \|w(q)^{\frac{1}{2}} \partial \tilde{g}_1\|_{L^2}^2 \leq \left\| w(q)^{\frac{1}{2}} \Upsilon\left(\frac{r}{t}\right) \frac{\bar{\partial} g_{LL}}{r} \right\|_{L^2} \|w(q)^{\frac{1}{2}} \partial \tilde{g}_1\|.$$

We estimate

$$\left\| w(q)^{\frac{1}{2}} \Upsilon\left(\frac{r}{t}\right) \frac{\bar{\partial} g_{LL}}{r} \right\|_{L^2} \lesssim \frac{1}{1+t} \|w(q)^{\frac{1}{2}} \partial g_{LL}\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}, \quad (1.14)$$

This yields

$$\frac{d}{dt} \|w(q)^{\frac{1}{2}} \partial \tilde{g}_1\|_{L^2} \leq \frac{\varepsilon^2}{(1+t)^{1-\rho}}.$$

So

$$\|w(q)^{\frac{1}{2}} \partial \tilde{g}_1\|_{L^2} \leq \varepsilon^2(1+t)^\rho,$$

which is precisely the behaviour we are trying to avoid with this decomposition ! However we have not been able to exploit all the decay in t in (1.14). In order to do so, we will use different weight functions for \tilde{g}_1 and for g_{LL} . If we set

$$w(q) = (1 + |q|)^{2\sigma} w_1(q),$$

and we assume that we have

$$\|w(q)^{\frac{1}{2}} \partial g_{LL}\|_{L^2} \lesssim \varepsilon^2(1+t)^\rho,$$

then we can estimate

$$\left\| w_1(q)^{\frac{1}{2}} \Upsilon\left(\frac{r}{t}\right) \frac{\bar{\partial} g_{LL}}{r} \right\|_{L^2} \lesssim \frac{1}{1+t} \left\| w(q)^{\frac{1}{2}} \Upsilon\left(\frac{r}{t}\right) \frac{\bar{\partial} g_{LL}}{(1+|q|)^\sigma} \right\|_{L^2}.$$

We write

$$|\bar{\partial} h| \lesssim \frac{1}{1+s} |Zh| \lesssim \frac{1}{(1+s)^\sigma (1+|q|)^{1-\sigma}} |Zh|,$$

so we obtain

$$\left\| w_1(q)^{\frac{1}{2}} \Upsilon\left(\frac{r}{t}\right) \frac{\bar{\partial} g_{LL}}{r} \right\|_{L^2} \lesssim \frac{1}{(1+t)^{1+\sigma}} \left\| w(q)^{\frac{1}{2}} \frac{Z g_{LL}}{1+|q|} \right\|_{L^2} \lesssim \frac{1}{(1+t)^{1+\sigma}} \|w(q)^{\frac{1}{2}} \partial Z g_{LL}\|_{L^2},$$

where we used the weighted Hardy inequality. Consequently, the energy inequality for \tilde{g}_1 yields

$$\frac{d}{dt} \|w_1(q)^{\frac{1}{2}} \partial \tilde{g}_1\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1+\sigma-\rho}},$$

and therefore, if $\sigma > \rho$

$$\|w_1(q)^{\frac{1}{2}} \partial \tilde{g}_1\|_{L^2} \lesssim \varepsilon^2.$$

Recall that the weighted energy inequality forbids weights of the form $(1+|q|)^\alpha$ with $\alpha > 0$ in the region $q < 0$. Therefore we are forced to make the following choice in the region $q < 0$

$$w(q) = O(1), \quad w_1(q) = \frac{1}{(1+|q|)^{2\sigma}}.$$

Thus, for \tilde{g}_1 , the t^ρ loss has been replaced by a loss in $(1+|q|)^\sigma$.

2 The background metric

2.1 A change of variable

Let $a_0, a_1, a_2 \in \mathbb{R}$ given by Theorem 1.3. They satisfy

$$|a_0| + |a_1| + |a_2| \leq \varepsilon^2,$$

we will note $a(\theta) = a_0 + a_1 \cos(\theta) + a_2 \sin(\theta)$. Let $b(\theta, s)$ satisfying the following set of hypothesis

$$\int \frac{b(\theta, s)}{1+b(\theta, s)} = 0, \tag{2.1}$$

$$\|Z^{N-11}b\|_{H^2(\mathbb{S}^1)} \leq \frac{\varepsilon^2}{(1+s)^2}, \tag{2.2}$$

$$\|Z^{N-1}b\|_{H^2(\mathbb{S}^1)} \leq \varepsilon^2, \tag{2.3}$$

$$\|\partial_s Z^{N-1}b\|_{H^1(\mathbb{S}^1)} \leq \frac{\varepsilon^2}{(1+s)^{2-\frac{1}{2}\sigma}}, \tag{2.4}$$

$$\|Z^N b\|_{H^2(\mathbb{S}^1)} \leq \varepsilon^2 (1+s)^\rho, \tag{2.5}$$

$$\int_0^S (1+s) \|\partial_s Z^N b\|_{H^2(\mathbb{S}^1)}^2 \leq \varepsilon^4 (1+S)^{2\rho}, \tag{2.6}$$

$$\int_0^S (1+s)^{1-4\rho} \|\partial_s Z^N b\|_{H^2(\mathbb{S}^1)}^2 \leq \varepsilon^4, \tag{2.7}$$

$$\int_0^S (1+s)^{3-\sigma} \|\partial_s^3 Z^N b\|_{L^2(\mathbb{S}^1)}^2 \leq \varepsilon^4 (1+S)^{2\rho}, \tag{2.8}$$

and we can write

$$\partial_s b = f_1 + f_2 \tag{2.9}$$

with

$$\|Z^N f_1\|_{L^2(\mathbb{S}^1)} \leq \varepsilon^2 (1+s)^{-\frac{3}{2}+\rho}, \tag{2.10}$$

$$\|Z^N f_2\|_{L^2(\mathbb{S}^1)} \leq \varepsilon^2 (1+s)^{\frac{1}{2}\sigma-2}, \tag{2.11}$$

$$\int_0^S (1+s)^4 \|\partial_s Z^N f_1\|_{L^2(\mathbb{S}^1)}^2 ds \leq \varepsilon^4 (1+S)^{2\rho}, \quad (2.12)$$

$$\int_0^S (1+s)^{3-2\rho} \|Z^N f_2\|_{H^1(\mathbb{S}^1)}^2 ds \leq \varepsilon^4 (1+S)^{2\rho}, \quad (2.13)$$

$$\int_0^S (1+s)^3 \|\partial_s Z^N f_2\|_{H^1(\mathbb{S}^1)}^2 ds \leq \varepsilon^4 (1+S)^{2\rho}, \quad (2.14)$$

$$\int_0^S (1+s)^3 \|\partial_s Z^N f_1\|_{H^1(\mathbb{S}^1)}^2 ds \leq \varepsilon^4 (1+S)^{2\rho}, \quad (2.15)$$

$$\int_0^S (1+s)^2 \|Z^N f_1\|_{H^1(\mathbb{S}^1)}^2 ds \leq \varepsilon^4 (1+S)^{2\rho}. \quad (2.16)$$

We note \mathcal{H} the set of hypothesis (2.1) to (2.16).

We begin by constructing a Ricci flat metric in the following way : we start with the Ricci flat metric

$$g^0 = ds' dq' + (r' + a(\theta')q)^2 (d\theta')^2 + J(\theta') d\theta' dq'.$$

We perform the change of coordinates

$$\begin{aligned} s' &= (1 + b(\theta, s))s - (\partial_\theta b(\theta, s))^2 (1 + b(\theta, s))^{-1} q, \\ q' &= (1 + b(\theta, s))^{-1} q, \\ \theta' &= \theta - \frac{q}{r} \frac{\partial_\theta b(\theta, s)}{(1 + b(\theta, s))^2} + f(\theta, s), \end{aligned}$$

where $f(\theta, s)$ is such that

$$1 + \partial_\theta f(\theta, s) = (1 + b(\theta, s))^{-1},$$

and we note

$$r = \frac{1}{2}(s + q), \quad t = \frac{1}{2}(s - q).$$

In the following proposition, we estimate the coefficient of g^0 in the null frame $L = \partial_t + \partial_r$, $\underline{L} = \partial_t - \partial_r$, $U = \frac{\partial_\theta}{r}$.

Proposition 2.1. *We can write $g^0 = \sigma^0 + \sigma^1$ where*

$$\begin{aligned} \sigma^0(L, \underline{L}) &= -2, \\ \sigma^0(U, \underline{L}) &= s(1 + b)\partial_s f, \\ \sigma^0(U, U) &= 1 + \frac{q}{r}h(\theta, s), \end{aligned}$$

where

$$h(\theta, s) = 2b_0(\theta') + 1 - (1 + b)^2 - 2(1 + b)\partial_\theta \left(\frac{\partial_\theta b}{(1 + b)^2} \right) - (1 + b)(\partial_\theta b)^2 - 2(1 + b)^{-2}(\partial_\theta b)^2, \quad (2.17)$$

and we have the estimates (we denote by ∂_θ^α any product of α or less vector field ∂_θ) :

$$|Z^I g^0| \lesssim s|\partial_s Z^I b| + q|\partial_s \partial_\theta Z^I b| + \frac{q}{s}|Z^I \partial_\theta^2 b|, \quad (2.18)$$

$$|Z^I \sigma_{\mathcal{T}\mathcal{T}}^1| \lesssim |\partial_s Z^I b| + \frac{q}{s}|\partial_s \partial_\theta Z^I b| + \frac{q^2}{s^2}|\partial_\theta Z^I b|. \quad (2.19)$$

Moreover we have

$$|\partial_q Z^I g^0| \lesssim \frac{1}{(1 + |q|)} |Z^I g_0|, \quad (2.20)$$

$$|\partial_s Z^I g^0| \lesssim s|\partial_s^2 Z^I b| + |\partial_s Z^I b| + q|\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s}|\partial_s \partial_\theta^2 Z^I b| + \frac{q}{s^2}|\partial_\theta^2 Z^I b|. \quad (2.21)$$

Proof. We have

$$\begin{aligned}
ds' &= (1 + b(\theta, s))ds + \partial_\theta b(\theta, s)s d\theta + \partial_s b(\theta, s)s ds - (\partial_\theta b(\theta, s))^2(1 + b(\theta, s))^{-1}dq \\
&\quad - \partial_\theta ((\partial_\theta b(\theta, s))^2(1 + b(\theta, s))^{-1}) dq d\theta - \partial_s ((\partial_\theta b(\theta, s))^2(1 + b(\theta, s))^{-1}) q ds \\
dq' &= (1 + b(\theta, s))^{-1}dq - q(1 + b(\theta, s))^{-2}\partial_\theta b(\theta, s)d\theta - q(1 + b(\theta, s))^{-1}\partial_s b(\theta, s)ds, \\
d\theta' &= \left((1 + b(\theta, s))^{-1} - \frac{q}{r}\partial_\theta \left(\frac{\partial_\theta b(\theta, s)}{(1 + b(\theta, s))^2} \right) \right) d\theta + \partial_s f(\theta, s)ds \\
&\quad + \frac{\partial_\theta b(\theta, s)}{(1 + b(\theta, s))^2} \left(\frac{q}{2r^2}ds - \frac{s}{2r^2}dq \right) + \frac{q}{r}\partial_s \left(\frac{\partial_\theta b(\theta, s)}{(1 + b(\theta, s))^2} \right) ds
\end{aligned}$$

and also

$$\begin{aligned}
r' &= \frac{1}{2} \left((1 + b(\theta, s))s - \frac{1}{(1 + b(\theta, s))}(\partial_\theta b(\theta, s))^2 q + (1 + b(\theta, s))^{-1}q \right) \\
&= (1 + b)r - \frac{1}{2(1 + b(\theta, s))}(\partial_\theta b)^2 q + \frac{1}{2}((1 + b)^{-1} - (1 + b))q.
\end{aligned}$$

We estimate, noticing that a term of the form $\frac{b}{s}$ gives similar contribution than $s\partial_s b$, and neglecting quadratic terms with similar or better behaviour that a term which is already present,

$$\begin{aligned}
ds' &= (1 + b + O(s\partial_s b) + O(q\partial_s \partial_\theta b))ds - (1 + b)^{-1}(\partial_\theta b)^2 dq + (s\partial_\theta b + O(\varepsilon^2 q \partial_\theta^2 b)) d\theta, \\
dq' &= O(q\partial_s b)ds + (1 + b)^{-1}dq - q(1 + b)^{-2}\partial_\theta b d\theta,
\end{aligned}$$

and consequently

$$\begin{aligned}
ds' dq' &= (1 + O(s\partial_s b) + O(q\partial_s \partial_\theta b)) ds dq - (\partial_\theta b)^2(1 + b)^{-2} dq^2 + O(q\partial_s \partial_\theta b) ds^2 \\
&\quad + (-qs(1 + b)^{-2}(\partial_\theta b)^2 + O(\varepsilon^4 q^2 \partial_\theta^2 b)) d\theta^2 \\
&\quad + (-q\partial_\theta b(1 + b)^{-1} + O(\varepsilon qs\partial_s \partial_\theta b)) ds d\theta + (s(1 + b)^{-1}(\partial_\theta b) + O(\varepsilon^2 q \partial_\theta^2 b)) dq d\theta.
\end{aligned}$$

We also estimate

$$\begin{aligned}
&(1 + b)^2 r^2 (d\theta')^2 \\
&= \left(r^2 - 2qr(1 + b)\partial_\theta \left(\frac{\partial_\theta b}{(1 + b)^2} \right) + O(\varepsilon q \partial_\theta^2 b) \right) d\theta^2 + (q\partial_\theta b(1 + b)^{-1} + (1 + b)r^2 \partial_s f) ds d\theta \\
&\quad - s\partial_\theta b(1 + b)^{-1} dq d\theta + O(r^2 (\partial_s f)^2) ds^2 + \left(((1 + b)^{-2}(\partial_\theta b)^2 + O\left(\frac{\varepsilon q}{s} \partial_\theta b\right)) \right) dq^2
\end{aligned}$$

and

$$(r' + b_0(\theta')q')^2 - (1 + b)^2 r^2 = rq(2b_0(\theta + f) - (1 + b)(\partial_\theta b)^2 + (1 - (1 + b)^2)) + O(q^2 \varepsilon^2 \partial_\theta b).$$

Consequently, we can estimate the coefficients of the metric g^0 in coordinates s, q, θ

$$\begin{aligned}
g_{sq}^0 &= 1 + O(s\partial_s b) + O(q\partial_s \partial_\theta b), \\
g_{ss}^0 &= O(q\partial_s \partial_\theta b), \\
g_{qq}^0 &= O\left(\frac{q}{s}(\partial_\theta b)^2\right), \\
g_{s\theta}^0 &= r^2(1 + b)\partial_s f + O(sq\partial_s \partial_\theta b), \\
g_{q\theta}^0 &= J(\theta')(1 + b)^{-2} + O(\varepsilon^2 q \partial_\theta^2 b), \\
g_{\theta\theta}^0 &= r^2 + qr \left(2b_0(\theta') + 1 - (1 + b)^2 - 2(1 + b)\partial_\theta \left(\frac{\partial_\theta b}{(1 + b)^2} \right) - (1 + b)(\partial_\theta b)^2 - 2(1 + b)^{-2}(\partial_\theta b)^2 \right) \\
&\quad + O(\varepsilon q^2 \partial_\theta^2 b).
\end{aligned}$$

To obtain the estimates for $Z^I g^0$, we note that we have the following expression for the commutator of Z with ∂_s

$$[S, \partial_s] = \partial_s, \quad [\Omega_{0,1}, \partial_s] = \cos(\theta)\partial_s - \frac{q}{2r^2}\sin(\theta)\partial_\theta, \quad [\Omega_{0,2}, \partial_s] = \sin(\theta)\partial_s + \frac{q}{2r^2}\cos(\theta)\partial_\theta.$$

We see that if we isolate the contribution $r^2(1+b)\partial_s f$ in $g_{s\theta}^0$ and rqh in $g_{\theta\theta}^0$ we obtain the desired estimates for σ^1 . \square

We call g_b the metric whose coefficients in the coordinates s', q', θ' are given by the coefficients above, where the terms involving b or f are multiplied by a cut-off function $\chi(q)$. From now on in the paper, χ will be a cut-off function such that

$$\chi(q) = 1, \text{ for } q \geq R+1, \quad \chi(q) = 0, \text{ for } q \leq R + \frac{1}{2}.$$

In particular, when $\chi = 0$, g_b is isometric to Minkowski metric and when $\chi = 1$, g_b is isometric to g^0 .

Corollary 2.2. *We have for $I \leq N-2$*

$$|Z^I g^0| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{4}}} + \frac{\varepsilon^2(1+|q|)}{(1+s)}, \quad (2.22)$$

$$|Z^I \sigma_{\mathcal{T}\mathcal{T}}^1| \lesssim \frac{\varepsilon^2 q}{(1+s)^{\frac{7}{4}}} + \frac{\varepsilon^2 q}{(1+s)^2}. \quad (2.23)$$

For $I \leq N-11$ we have

$$|Z^I g^0| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)}. \quad (2.24)$$

Proof. We have thanks to (2.4) and the Sobolev embedding $H^1(\mathbb{S}^1) \subset L^\infty$

$$|\partial_s \partial_\theta Z^I b| \lesssim \|\partial_s Z^{I+1} b\|_{H^1(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+s)^{2-\frac{1}{4}}}, \text{ for } I \leq N-2$$

and

$$|\partial_\theta^2 Z^I b| \lesssim \|Z^{I+1} b\|_{H^1} \lesssim \varepsilon^2, \text{ for } I \leq N-2.$$

Consequently,

$$\begin{aligned} |Z^{N-2} g^0| &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{4}}} + \frac{\varepsilon^2(1+|q|)}{(1+s)}, \\ |Z^{N-2} \sigma_{\mathcal{T}\mathcal{T}}^1| &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{7}{4}}} + \frac{\varepsilon^2(1+|q|)^2}{(1+s)^2}. \end{aligned}$$

Thanks to (2.2) we have, for $I \leq N-11$

$$|\partial_s \partial_\theta Z^I b| \lesssim \|\partial_s Z^I b\|_{H^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+s)^2}$$

and consequently

$$\begin{aligned} |Z^{N-11} g^0| &\lesssim \frac{\varepsilon^2(1+|q|)}{(1+s)}, \\ |Z^{N-11} \sigma_{\mathcal{T}\mathcal{T}}^1| &\lesssim \frac{\varepsilon^2(1+|q|)^2}{(1+s)^2}, \end{aligned}$$

which concludes the proof of Corollary 2.2. \square

2.2 Calculation of the Ricci tensor

We now turn to the estimate for the Ricci coefficients of g_b .

Proposition 2.3. *We can write $R = R^0 + R^1$, where*

$$R_{U\underline{L}}^0 = -\partial_q^2(\chi(q))\sigma_{UL}^0, \quad R_{\underline{L}\underline{L}}^0 = 4\frac{\partial_q^2(q\chi(q))}{r}h(\theta, s),$$

and

$$|Z^I R^1| \lesssim \mathbb{1}_{R \leq q \leq R+1} \left(|s\partial_s^2 Z^I b| + |\partial_s^2 \partial_\theta Z^I b| + |\partial_s \partial_\theta Z^I b| + \frac{1}{s^2} |\partial_\theta^2 Z^I b| \right),$$

$$|Z^I R_{LL}^1| \lesssim \mathbb{1}_{R \leq q \leq R+1} \left(|\partial_s^2 \partial_\theta Z^I b| + |\partial_s \partial_\theta Z^I b| + \frac{1}{s^2} |\partial_\theta^2 Z^I b| \right).$$

Proof. When $\chi = 0$, g_b is isometric to Minkowski metric, and when $\chi = 1$, g_b is isometric to g^0 which is Ricci flat, so the Ricci coefficients are non zero only in the region where χ is non constant, that is to say near the null cone. Since $g^0 - m = O\left(\frac{\varepsilon^2}{r}\right)$ in the neighbourhood of the light cone, all the quadratic terms are a $O\left(\frac{\varepsilon^4 \chi'(q)}{r^2} \mathbb{1}_{R \leq q \leq R+1}\right)$ and are easier to estimate than the non quadratic terms. The non quadratic terms have to involve a term containing $\chi'(q)$. We calculate in s, q, θ coordinates. We note that for Minkowski metric the non zero Christoffel symbols are

$$\Gamma_{\theta s}^\theta = \Gamma_{\theta q}^\theta = \frac{1}{2r}, \quad \Gamma_{\theta\theta}^s = \Gamma_{\theta\theta}^q = -\frac{r}{2}.$$

We can consequently neglect the terms involving one of these symbols : they give contributions which are $O\left(\frac{\chi'(q)}{r}(g^0 - m)\right)$.

$$\begin{aligned} R_{qq} &= \partial_q \Gamma_{qq}^q + \partial_s \Gamma_{qq}^s + \partial_\theta \Gamma_{qq}^\theta - \partial_q \Gamma_{qq}^q - \partial_q \Gamma_{qs}^s - \partial_q \Gamma_{q\theta}^\theta + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right) \\ &= \frac{2}{2} \partial_s \partial_q g_{qq} + g^{\theta\theta} \partial_\theta \partial_q g_{q\theta} - \frac{1}{2} \partial_q \partial_s g_{sq} - \frac{1}{2} g^{\theta\theta} \partial_q^2 g_{\theta\theta} + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right) \\ &= \frac{1}{r} \partial_q^2 (q\chi(q)) h(\theta, s) + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right), \end{aligned}$$

$$\begin{aligned} R_{sq} &= \partial_q \Gamma_{sq}^q + \partial_s \Gamma_{sq}^s + \partial_\theta \Gamma_{sq}^\theta - \partial_s \Gamma_{sq}^q - \partial_s \Gamma_{qs}^s - \partial_s \Gamma_{q\theta}^\theta + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right) \\ &= \frac{2}{2} \partial_q \partial_q g_{ss} + \frac{1}{2} g^{\theta\theta} \partial_\theta \partial_q g_{s\theta} - 2 \partial_s \partial_q g_{sq} - \frac{2}{2} g^{\theta\theta} \partial_s \partial_q g_{\theta\theta} + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right) \\ &= O(s\chi'(q)\partial_s^2 b) + O(q\chi'(q)\partial_s^2 \partial_\theta b) + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right), \end{aligned}$$

$$\begin{aligned} R_{ss} &= \partial_q \Gamma_{ss}^q + \partial_s \Gamma_{ss}^s + \partial_\theta \Gamma_{ss}^\theta - \partial_s \Gamma_{sq}^q - \partial_s \Gamma_{ss}^s - \partial_s \Gamma_{s\theta}^\theta + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right) \\ &= \frac{2}{2} \partial_q \partial_s g_{ss} - \frac{2}{2} \partial_s \partial_q g_{ss} + O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right) \\ &= O\left(\frac{\chi'(q)}{r}(g^0 - m)\right) + O\left(\frac{\varepsilon^4 \chi'(q)}{r^2}\right), \end{aligned}$$

$$\begin{aligned}
R_{s\theta} &= \partial_q \Gamma_{s\theta}^q + \partial_s \Gamma_{s\theta}^s + \partial_\theta \Gamma_{s\theta}^\theta - \partial_s \Gamma_{\theta q}^q - \partial_s \Gamma_{\theta s}^s - \partial_s \Gamma_{\theta\theta}^\theta + O(\chi'(q)(g^0 - m)) + 0\left(\frac{\varepsilon^4 \chi'(q)}{r}\right) \\
&= \frac{2}{2} \partial_q \partial_\theta g_{ss} - \frac{2}{2} \partial_s \partial_q g_{s\theta} + O(\chi'(q)(g^0 - m)) + 0\left(\frac{\varepsilon^4 \chi'(q)}{r}\right) \\
&= 0(s^2 \chi'(q) \partial_s^2 b) + 0(s \chi'(q) \partial_s^2 \partial_\theta b) + O(\chi'(q)(g^0 - m)) + 0\left(\frac{\varepsilon^4 \chi'(q)}{r}\right),
\end{aligned}$$

$$\begin{aligned}
R_{q\theta} &= \partial_q \Gamma_{q\theta}^q + \partial_s \Gamma_{q\theta}^s + \partial_\theta \Gamma_{q\theta}^\theta - \partial_q \Gamma_{\theta q}^q - \partial_q \Gamma_{\theta s}^s - \partial_q \Gamma_{\theta\theta}^\theta + O(\chi'(q)(g^0 - m)) + 0\left(\frac{\varepsilon^4 \chi'(q)}{r}\right) \\
&= \frac{2}{2} g^{\theta\theta} \partial_\theta \partial_q g_{\theta\theta} - \frac{2}{2} \partial_q (\partial_\theta g_{qs} + \partial_s g_{\theta q} - \partial_q g_{s\theta}) - \frac{1}{2} g^{\theta\theta} \partial_q \partial_\theta g_{\theta\theta} + O(\chi'(q)(g^0 - m)) + 0\left(\frac{\varepsilon^4 \chi'(q)}{r}\right) \\
&= \partial_q^2 g_{s\theta} + O(s^2 \chi'(q) \partial_s^2 b) + O(\chi'(q)(g^0 - m)) + 0\left(\frac{\varepsilon^4 \chi'(q)}{r}\right),
\end{aligned}$$

$$\begin{aligned}
R_{\theta\theta} &= \partial_q \Gamma_{\theta\theta}^q + \partial_s \Gamma_{\theta\theta}^s + \partial_\theta \Gamma_{\theta\theta}^\theta - \partial_\theta \Gamma_{\theta q}^q - \partial_\theta \Gamma_{\theta s}^s - \partial_\theta \Gamma_{\theta\theta}^\theta + O(r \chi'(q)(g^0 - m)) + 0(\varepsilon^4 \chi'(q)) \\
&= \frac{2}{2} \partial_q (2 \partial_\theta g_{s\theta} - \partial_s g_{\theta\theta}) - \frac{2}{2} \partial_s \partial_q g_{\theta\theta} - \frac{2}{2} \partial_\theta \partial_q g_{\theta s} + \frac{2}{2} \partial_\theta \partial_q g_{\theta s} + O(r \chi'(q)(g^0 - m)) + 0(\varepsilon^4 \chi'(q)) \\
&= O(s \chi'(q) \partial_s \partial_\theta^2 b) + O(r \chi'(q)(g^0 - m)) + 0(\varepsilon^4 \chi'(q)).
\end{aligned}$$

We note that all these terms give contributions which are $O\left(\frac{\varepsilon^2 \chi'(q)}{r^2}\right)$ except the contribution of $\frac{1}{r} \partial_q^2 (q \chi(q)) h(\theta, s)$ in R_{qq} and the contribution of $\partial_q^2 g_{s\theta}$ (more precisely the term $\frac{1}{2} \partial_q^2 \chi(q) \sigma_{s\theta}^0$) in $R_{q\theta}$. \square

2.3 The generalized wave coordinates

We will look for solutions of the form $g = g_b + \tilde{g}$. We will work in generalized wave coordinates, chosen as follows. First we need them to be compatible with our choice of background metric. We will note

$$F_b^\alpha = \square_{g_b} x^\alpha.$$

Next we need to get rid of the artificial bad term $\sigma_{UL}^0 \partial_q^2 \chi(q)$ in R_{UL} . If we look at (1.8), we see that this contribution can only come from $\frac{1}{2} g_{UU} \partial_L F_b^U$, and consequently from a term of the form $-\sigma_{UL}^0 \chi'(q)$ in $U_\alpha F^\alpha$. Consequently, we will modify the wave coordinate condition to remove this term. We also want to take a coordinate choice in which the quadratic nonlinearities in our system satisfy the null condition. For these two reasons, we introduce the vector-valued function G such that

$$U_\alpha G^\alpha = \sigma_{UL}^0 \chi'(q), \quad (2.25)$$

$$L_\alpha G^\alpha = \frac{1}{r} \Upsilon\left(\frac{r}{r}\right) \int_\infty^r (2(\partial_q \phi)^2 r - h(\theta, 2t) \chi'(q)) dr, \quad (2.26)$$

$$\underline{L}_\alpha G^\alpha = 0 \quad (2.27)$$

Finally, we will work in generalized coordinate such that

$$H^\alpha = g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha = F^\alpha + G^\alpha + \tilde{G}^\alpha, \quad (2.28)$$

where \tilde{G}^α contains the terms of the form $\tilde{g} \partial_s^l \partial_\theta^k b$, where $l + k - 2 \geq 1$ or $l \geq 2$. In generalized wave coordinates, the expression (1.8) allows us to write the system (1.1) into the form

$$\begin{cases} \square_g \phi = 0 \\ \square_g g_{\mu\nu} = -4\partial_\mu \phi \partial_\nu \phi + P_{\mu\nu}(\partial g, \partial g) + g_{\mu\rho} \partial_\nu H^\rho + g_{\nu\rho} \partial_\mu H^\rho, \end{cases} \quad (2.29)$$

where

$$\begin{aligned} P_{\mu\nu}(g)(\partial g, \partial g) &= \frac{1}{2} g^{\alpha\rho} g^{\beta\sigma} \left(\partial_\mu g_{\rho\sigma} \partial_\alpha g_{\beta\nu} + \partial_\nu g_{\rho\sigma} \partial_\alpha g_{\beta\mu} - \partial_\beta g_{\mu\rho} \partial_\alpha g_{\nu\sigma} - \frac{1}{2} \partial_\mu g_{\alpha\beta} \partial_\nu g_{\rho\sigma} \right) \\ &\quad + \frac{1}{2} g^{\alpha\beta} g^{\lambda\rho} \partial_\alpha g_{\nu\rho} \partial_\beta g_{\mu\rho}. \end{aligned} \quad (2.30)$$

Remark 2.4. In generalized wave coordinates, the wave operator can be expressed as

$$\square_g = g^{\alpha\rho} \partial_\alpha \partial_\rho - H_b^\rho \partial_\rho.$$

The expression (1.8) yields also

$$(R_b)_{\mu\nu} = -\frac{1}{2} \square_{g_b} (g_b)_{\mu\nu} + \frac{1}{2} P_{\mu\nu}(g_b)(\partial g_b, \partial g_b) + \frac{1}{2} ((g_b)_{\mu\rho} \partial_\nu F_b^\rho + (g_b)_{\nu\rho} \partial_\mu F_b^\rho). \quad (2.31)$$

Therefore, subtracting twice the equation (2.31) to the second equation of (2.29) we obtain

$$\begin{cases} \square_g \phi = 0, \\ \square_g \tilde{g}_{\mu\nu} = -4\partial_\mu \phi \partial_\nu \phi + 2(R_b)_{\mu\nu} + g_{\mu\rho} \partial_\nu G_b^\rho + g_{\nu\rho} \partial_\mu G_b^\rho + P_{\mu\nu}(g)(\partial \tilde{g}, \partial \tilde{g}) + \tilde{P}_{\mu\nu}(\tilde{g}, g_b), \end{cases} \quad (2.32)$$

where $P_{\mu\nu}(g)(\partial \tilde{g}, \partial \tilde{g})$ is defined by (2.30) and

$$\begin{aligned} \tilde{P}_{\mu\nu}(\tilde{g}, g_b) &= (g_b^{\alpha\beta} - g^{\alpha\beta}) \partial_\alpha \partial_\beta (g_b)_{\mu\nu} + (G^\rho + \tilde{G}^\rho) \partial_\rho (g_b)_{\mu\nu} \\ &\quad + P_{\mu\nu}(g)(\partial g, \partial g) - P_{\mu\nu}(g)(\partial \tilde{g}, \partial \tilde{g}) - P_{\mu\nu}(g_b)(\partial g_b, \partial g_b) \\ &\quad + \tilde{g}_{\mu\rho} \partial_\nu (F^\rho) + \tilde{g}_{\nu\rho} \partial_\mu (F^\rho) + g_{\mu\rho} \partial_\nu \tilde{G}^\rho + g_{\nu\rho} \partial_\mu \tilde{G}^\rho. \end{aligned} \quad (2.33)$$

Let us note that $\tilde{P}_{\mu\nu}(\tilde{g}, g_b)$ contains only crossed terms between g_b and \tilde{g} .

2.4 Second version of Theorem 1.12

We give here a more precise version of Theorem 1.12.

Theorem 2.5. Let $0 < \varepsilon < 1$. Let $\frac{1}{2} < \delta < 1$ and $N \geq 40$. Let $(\phi_0, \phi_1) \in H^{N+2}(\mathbb{R}^2) \times H^{N+1}(\mathbb{R}^2)$ compactly supported in $B(0, R)$. We assume

$$\|\phi_0\|_{H^{N+2}} + \|\phi_1\|_{H^{N+1}} \leq \varepsilon.$$

Let $\varepsilon \ll \rho \ll \sigma \ll \delta$ such that $\delta - 2\sigma > \frac{1}{2}$. If ε is small enough, there exists a global solution (g, ϕ) of (1.1). More precisely there exists $b(\theta, s)$ satisfying the set of hypothesis \mathcal{H} , and a set of generalized wave coordinates (t, x^1, x^2) defined by (2.28) such that we can write in these coordinates $g = g_b + \tilde{g}$, where g_b is defined in Section 2.1. We have the estimates for \tilde{g}, ϕ

$$|\tilde{g} - m| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}}, \quad |\phi| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{1}{2}-4\rho}},$$

$$\|\partial Z^N \phi\|_{L^2} + \|\partial^2 Z^N \phi\|_{L^2} + \|w_2 \partial Z^N \tilde{g}\|_{L^2} \lesssim \varepsilon(1+t)^{2\rho},$$

where

$$\begin{cases} w_2(q) = (1+|q|)^{2+2\delta-4\sigma}, & \text{for } q > 0 \\ w_2(q) = (1+|q|)^{-1-2\sigma}, & \text{for } q < 0. \end{cases}$$

Moreover, for $h(\theta, s)$ defined by (2.17), we have

$$\int_0^\infty 2(\partial_q \phi(t, r, \theta))^2 r dr - h(\theta, 2t) = O\left(\frac{\varepsilon^2}{\sqrt{1+t}}\right).$$

3 Bootstrap assumptions and proof of Theorem 1.12

3.1 Bootstrap assumptions

Let ρ, σ, μ such that $\varepsilon \ll \rho \ll \sigma \ll \delta$, and

$$\delta - 2\sigma > \frac{1}{2}, \quad \sigma \leq \frac{1}{4}, \quad \mu \leq \frac{1}{4}$$

The initial data (ϕ_0, ϕ_1) for ϕ are given in $H^{N+2} \times H^N(\mathbb{R}^2)$, compactly supported in $B(0, R)$. Let b which satisfy the set of estimates \mathcal{H} . We construct a metric g_b as described before. There exists initial data for g (see Appendix B), such that we can write at $t = 0$

$$g = g_b + \tilde{g}_0, \quad \partial_t g = \partial_t g_b + \tilde{g}_1$$

with $(\tilde{g}_0, \tilde{g}_1) \in H_\delta^{N+1} \times H_{\delta+1}^N$ and

- the constraint equations are satisfied at $t = 0$,
- the generalized wave coordinate condition is satisfied at $t = 0$.

We consider a time T such that there exists a solution $g = g_b + \tilde{g}, \phi$ on $[0, T]$ of (2.32). We assume that on $[0, T]$ the following estimates hold

L^∞ -based bootstrap assumptions For $I \leq N - 9$ we assume

$$|Z^I \phi| \leq \frac{2C_0 \varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{1}{2}-4\rho}}, \quad (3.1)$$

$$|Z^I \tilde{g}| \leq \frac{2C_0 \varepsilon}{(1+s)^{\frac{1}{2}-\rho}}, \quad (3.2)$$

where here and in the following, C_0 is a constant depending on $\rho, \sigma, \mu, \delta, N$ such that the inequalities are satisfied at $t = 0$ with $2C_0$ replaced by C_0 . For $I \leq N - 7$ we assume

$$|Z^I \phi| \leq \frac{2C_0 \varepsilon}{(1+s)^{\frac{1}{2}-2\rho}}, \quad (3.3)$$

$$|Z^I \tilde{g}| \leq \frac{2C_0 \varepsilon}{(1+s)^{\frac{1}{2}-3\rho}}. \quad (3.4)$$

L^2 -based bootstrap assumptions We introduce three weight functions

$$\begin{cases} w(q) = (1+|q|)^{2+2\delta}, & \text{for } q > 0 \\ w(q) = 1 + (1+|q|)^{-2\mu}, & \text{for } q < 0, \end{cases}$$

$$\begin{cases} w_1(q) = (1+|q|)^{2+2\delta-2\sigma}, & \text{for } q > 0 \\ w_1(q) = (1+|q|)^{-2\sigma}, & \text{for } q < 0, \end{cases}$$

$$\begin{cases} w_2(q) = (1+|q|)^{2+2\delta-4\sigma}, & \text{for } q > 0 \\ w_2(q) = (1+|q|)^{-1-2\sigma}, & \text{for } q < 0. \end{cases}$$

We introduce the following decompositions of the metric

$$g = g_b + \tilde{g}, \quad (3.5)$$

$$g = g_b + 4\Upsilon\left(\frac{r}{t}\right) k dq^2 + \tilde{g}_1, \quad (3.6)$$

$$(3.7)$$

where k satisfies

$$\square_g k = Q_{LL} = \partial_q g_{UU} \partial_q \tilde{g}_{LL} + \tilde{g}_{LL} \partial_q G^L. \quad (3.8)$$

We introduce this decomposition to exploit the weak null structure for cubic terms. Our L^2 -based bootstrap assumptions are the following.

Estimates for ϕ :

$$\|w^{\frac{1}{2}} \partial Z^N \phi\|_{L^2} \leq 2C_0 \varepsilon (1+t)^\rho, \quad (3.9)$$

$$\|w^{\frac{1}{2}} \partial^2 Z^N \phi\|_{L^2} \leq 2C_0 \varepsilon (1+t)^\rho, \quad (3.10)$$

$$\|w^{\frac{1}{2}} \partial (SZ^N \phi - s \partial_q \phi Z^N g_{LL})\|_{L^2} \leq 2C_0 \varepsilon (1+t)^\rho, \quad (3.11)$$

$$\|w^{\frac{1}{2}} \partial Z^{N+1} \phi\|_{L^2} \leq 2C_0 \varepsilon (1+t)^{\frac{1}{2}+\rho}, \quad (3.12)$$

$$\|w^{\frac{1}{2}} \partial Z^{N-1} \phi\|_{L^2} \leq 2C_0 \varepsilon, \quad (3.13)$$

Integrated estimates for $\bar{\partial} \phi$:

$$\int_0^t w'(q) (\bar{\partial} Z^N \phi)^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{2\rho} \quad (3.14)$$

$$\int_0^t w'(q) (\bar{\partial} \partial Z^N \phi)^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{2\rho} \quad (3.15)$$

$$\int_0^t w'(q) (\bar{\partial} (SZ^N \phi - s \partial_q \phi Z^N g_{LL}))^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{2\rho} \quad (3.16)$$

$$\int_0^t w'(q) (1+\tau)^{-1} (\bar{\partial} Z^{N+1} \phi)^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{2\rho} \quad (3.17)$$

Estimates for \tilde{g} :

$$\|w_2^{\frac{1}{2}} \partial Z^N \tilde{g}_1\|_{L^2} \leq 2C_0 \varepsilon (1+t)^\rho, \quad (3.18)$$

$$\|w_1^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2} \leq 2C_0 \varepsilon (1+t)^{2\rho}, \quad (3.19)$$

$$\|w^{\frac{1}{2}} \partial Z^{N-3} \tilde{g}\|_{L^2} \leq 2C_0 \varepsilon (1+t)^\rho, \quad (3.20)$$

$$\|w_1^{\frac{1}{2}} \partial Z^{N-4} \tilde{g}_1\|_{L^2} \leq 2C_0 \varepsilon, \quad (3.21)$$

$$\|\partial \tilde{Z}^{N-10} g_1\|_{L^2} \leq 2C_0 \varepsilon. \quad (3.22)$$

Integrated estimates for $\bar{\partial} \tilde{g}$

$$\int_0^t w'_2(q) (\bar{\partial} Z^N \tilde{g}_1)^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{2\rho}, \quad (3.23)$$

$$\int_0^t w'_1(q) (\bar{\partial} Z^N \tilde{g})^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{4\rho}, \quad (3.24)$$

$$\int_0^t (1+\tau)^{-2\rho} w'_1(q) (\bar{\partial} Z^N \tilde{g})^2 dx d\tau \leq 2C_0 \varepsilon^2 (1+t)^{2\rho}. \quad (3.25)$$

Bootstrap assumptions for h

$$\left\| \Pi Z^{N-1} \left(\int_0^\infty 2\partial_r \phi(t, r, \theta) \partial_t \phi(t, r, \theta) r dr + h(\theta, 2t) \right) \right\|_{L^2(\mathbb{S}^1)} \leq 2C_0 \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-2\rho}}. \quad (3.26)$$

$$\left\| \Pi Z^{N-5} \left(\int_0^\infty 2\partial_r \phi(t, r, \theta) \partial_t \phi(t, r, \theta) r dr + h(\theta, 2t) \right) \right\|_{L^2(\mathbb{S}^1)} \leq 2C_0 \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}}}. \quad (3.27)$$

We note

$$\begin{aligned} \Delta_h(t) = & \left| \int h(\theta, 2t) d\theta - \int_{\mathbb{R}^2} ((\partial_t \phi)^2 + |\nabla \phi|^2)(t, x) dx \right| + \left| \int h(\theta, 2t) \cos(\theta) d\theta + \int_{\mathbb{R}^2} 2(\partial_t \phi \partial_1 \phi)(t, x) dx \right| \\ & + \left| \int h(\theta, 2t) \sin(\theta) d\theta + \int_{\mathbb{R}^2} 2(\partial_t \phi \partial_2 \phi)(t, x) dx \right|. \end{aligned}$$

we assume

$$|\Delta_h| \leq 2C_0 \frac{\varepsilon}{\sqrt{1+t}}. \quad (3.28)$$

3.2 Proof of Theorem 1.12

We have the following improvements for the bootstrap assumptions. The constant C will denote a constant depending only on $\rho, \sigma, \mu, \delta, N$.

Proposition 3.1. *We have*

$$|\Delta_h| \leq \frac{C\varepsilon^2}{\sqrt{1+t}}.$$

The proof of Proposition 3.1 is the object of Section 6.

Proposition 3.2. *Let $I \leq N - 9$ we have*

$$\begin{aligned} |Z^I \phi| & \leq \frac{C_0 \varepsilon + C\varepsilon^2}{\sqrt{1+s}(1+|q|)^{\frac{1}{2}-4\rho}}, \\ |Z^I \tilde{g}| & \leq \frac{C_0 \varepsilon + C\varepsilon^2}{(1+s)^{\frac{1}{2}-\rho}}, \end{aligned}$$

let $I \leq N - 7$ we have

$$\begin{aligned} |Z^I \phi| & \leq \frac{C_0 \varepsilon + C\varepsilon^2}{(1+s)^{\frac{1}{2}-2\rho}}, \\ |Z^I \tilde{g}| & \leq \frac{C_0 \varepsilon + C\varepsilon^2}{(1+s)^{\frac{1}{2}-2\rho}}. \end{aligned}$$

The proof of Proposition 3.2 is the object of Section 7.

Proposition 3.3. *We have the estimates*

$$\begin{aligned} \|w^{\frac{1}{2}} \partial Z^N \phi\|_{L^2} & \leq C_0 \varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\ \|w^{\frac{1}{2}} \partial^2 Z^N \phi\|_{L^2} & \leq C_0 \varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\ \|w^{\frac{1}{2}} \partial(SZ^N \phi - s\partial_q \phi Z^N g_{LL})\|_{L^2} & \leq C_0 \varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\ \|w^{\frac{1}{2}} \partial Z^{N+1} \phi\|_{L^2} & \leq C_0 \varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\ \|w^{\frac{1}{2}} \partial Z^N \tilde{g}_1\|_{L^2} & \leq C_0 \varepsilon + C\varepsilon^{\frac{5}{4}}(1+t)^\rho, \\ \|w^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2} & \leq C_0 \varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^{2\rho}, \end{aligned}$$

and the integrated estimates

$$\begin{aligned}
\int_0^t w'(q)(\bar{\partial}Z^N\phi)^2 dx d\tau &\leq C_0\varepsilon^2 + C\varepsilon^3(1+t)^{2\rho}, \\
\int_0^t w'(q)(\bar{\partial}\partial Z^N\phi)^2 dx d\tau &\leq C_0\varepsilon^2 + C\varepsilon^3(1+t)^{2\rho}, \\
\int_0^t w'(q)(\bar{\partial}(SZ^N\phi - s\partial_q\phi Z^N g_{LL}))^2 dx d\tau &\leq C_0\varepsilon^2 + C\varepsilon^3(1+t)^{2\rho}, \\
\int_0^t w'(q)(1+\tau)^{-1}(\bar{\partial}Z^{N+1}\phi)^2 dx d\tau &\leq C_0\varepsilon^2 + C\varepsilon^3(1+t)^{2\rho}, \\
\int_0^t w'_2(q)(\bar{\partial}Z^N\tilde{g}_1)^2 dx d\tau &\leq C_0\varepsilon^2 + C\varepsilon^{\frac{5}{2}}(1+t)^{2\rho}, \\
\int_0^t w'_1(q)(\bar{\partial}Z^N\tilde{g})^2 dx d\tau &\leq C_0\varepsilon^2 + 2C\varepsilon^3(1+t)^{4\rho}, \\
\int_0^t (1+\tau)^{-2\rho}w'_1(q)(\bar{\partial}Z^N\tilde{g})^2 dx d\tau &\leq C_0\varepsilon^2 + 2C\varepsilon^3(1+t)^{4\rho}.
\end{aligned}$$

The proof of Proposition 3.3 is the object of Section 9.

Proposition 3.4. *We have the estimates*

$$\begin{aligned}
\|w^{\frac{1}{2}}\partial Z^{N-1}\phi\|_{L^2} &\leq C_0\varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\
\|w^{\frac{1}{2}}\partial Z^{N-3}\tilde{g}\|_{L^2} &\leq C_0\varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\
\|w_1^{\frac{1}{2}}\partial Z^{N-4}\tilde{g}_1\|_{L^2} &\leq C_0\varepsilon + C\varepsilon^{\frac{5}{4}}, \\
\|\partial\tilde{Z}^{N-10}g_1\|_{L^2} &\leq C_0\varepsilon + C\varepsilon^{\frac{5}{4}}.
\end{aligned}$$

The proof of Proposition 3.4 is the object of Section 10. To improve the estimate for h we set

$$h(\theta, 2t) = 2 \int_0^\infty (1+\beta)g^{0\alpha}\sqrt{|\det g|}\partial_\alpha\phi\partial_r\phi dr.$$

and extend it to infinity by

$$h'(\theta, s) = \psi(s)h(\theta, s) + (1-\psi(s))h(\theta, 2T),$$

where ψ is a cut-off function such that $\psi = 1$ for $s \leq 2T - 1$ and $\psi = 0$ for $s > 2T$.

Proposition 3.5. *h' satisfy the following estimates*

$$\|Z^{N-1}h'\|_{L^2(\mathbb{S}^1)} \leq C\varepsilon^2, \quad (3.29)$$

$$\|Z^N h'\|_{L^2(\mathbb{S}^1)} \leq \varepsilon^2(1+t)^\rho, \quad (3.30)$$

$$\|\partial_t Z^{N-11}h'\|_{L^2(\mathbb{S}^1)} \leq \frac{C\varepsilon^2}{(1+t)^2}, \quad (3.31)$$

$$\|\partial_t Z^{N-1}h'\|_{H^{-1}(\mathbb{S}^1)} \leq \frac{C\varepsilon^2}{(1+t)^{2-\frac{1}{2}\sigma}}, \quad (3.32)$$

$$\int_0^t (1+\tau)\|Z^N h'\|_{L^2(\mathbb{S}^1)}^2 d\tau \leq \varepsilon^2(1+t)^{2\rho}, \quad (3.33)$$

and we can write $\partial_t h' = h'_1 + h'_2$ with,

$$\int_0^t (1+\tau)^4 \|\partial_t Z^N h'_1\|_{H^{-2}(\mathbb{S}^1)}^2 d\tau \leq C\varepsilon^4(1+t)^2\rho, \quad (3.34)$$

$$\|Z^N h'_1\|_{H^{-2}(\mathbb{S}^1)} \leq C\varepsilon^2(1+t)^{\frac{1}{2}\sigma-2}, \quad (3.35)$$

$$\|Z^N h'_2\|_{H^{-2}(\mathbb{S}^1)} \leq C\varepsilon^2(1+t)^{\frac{3}{2}-\rho}, \quad (3.36)$$

$$\int_0^t (1+\tau)^{3-2\rho} \|Z^N h'_2\|_{H^{-1}(\mathbb{S}^1)}^2 d\tau \leq C\varepsilon^4(1+t)^{2\rho}, \quad (3.37)$$

$$\int_0^t (1+\tau)^3 \|\partial_t Z^N h'_2\|_{H^{-1}(\mathbb{S}^1)}^2 ds \leq C\varepsilon^4(1+t)^{2\rho}, \quad (3.38)$$

$$\int_0^t (1+\tau)^3 \|\partial_t Z^N h'_1\|_{H^{-1}(\mathbb{S}^1)}^2 d\tau \leq C\varepsilon^4(1+t)^2\rho, \quad (3.39)$$

$$\int_0^t (1+\tau)^2 \|Z^N h'_1\|_{H^{-1}(\mathbb{S}^1)}^2 d\tau \leq C\varepsilon^4(1+t)^2\rho, \quad (3.40)$$

and also

$$\left\| Z^{N-5} \left(\int_0^\infty \partial_r \phi(t, r, \theta) \partial_t \phi(t, r, \theta) r dr + h'(\theta, 2t) \right) \right\|_{L^2(\mathbb{S}^1)} \leq C \frac{\varepsilon^3}{\sqrt{1+t}}, \quad (3.41)$$

$$\left\| Z^{N-1} \left(\int_0^\infty \partial_r \phi(t, r, \theta) \partial_t \phi(t, r, \theta) r dr + h'(\theta, 2t) \right) \right\|_{L^2(\mathbb{S}^1)} \leq C \frac{\varepsilon^3(1+t)^\rho}{\sqrt{1+t}}. \quad (3.42)$$

The proof of Proposition 3.5 is the object of Section 11.1. We obtain b thanks to the following proposition

Proposition 3.6. *There exists $b_0(s), b_1(s), b_2(s)$ such that there exists a solution $b^{(2)}$ of*

$$\begin{aligned} & 2b_0(\theta + f) + 1 - (1+b)^2 - 2(1+b)\partial_\theta \left(\frac{\partial_\theta b}{(1+b)^2} \right) - (1+b)(\partial_\theta b)^2 - 2(1+b)^{-2}(\partial_\theta b)^2 \\ & = \Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta), \end{aligned}$$

and $b^{(2)}$ satisfy

$$\int \frac{b^{(2)}}{(1+b^{(2)})} d\theta = 0,$$

$$\|b^{(2)}\|_{H^{l+2}(\mathbb{S}^1)} \lesssim \|h'\|_{H^l(\mathbb{S}^1)},$$

$$\|\partial_s^k b^{(2)}\|_{H^{l+2}(\mathbb{S}^1)} \lesssim \|\partial_s^k h'\|_{H^l(\mathbb{S}^1)},$$

and

$$\begin{aligned} & |b_0 - a_0| + |b_1 - a_1| + |b_2 - a_2| \lesssim \varepsilon^4, \\ & |\partial_s^k b_0| + |\partial_s^k b_1| + |\partial_s^k b_2| \lesssim \varepsilon^2 \|\partial_s^k h'\|_{L^2(\mathbb{S}^1)}. \end{aligned}$$

The proof of Proposition 3.6 is the object of Section 11.2.

Proposition 3.7. *We set*

$$h^{(2)} = \Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta),$$

There exists a solution $(g^{(2)} = g_{b^{(2)}} + \tilde{g}^{(2)}, \phi(2))$ of (2.32) on $[0, T] \times \mathbb{R}^2$, in generalized wave coordinates

$$(H^{(2)})^\alpha = (g^{(2)})^{\lambda\beta} (\Gamma^{(2)})^\alpha_{\lambda\beta} = (F^{(2)})^\alpha + (G^{(2)})^\alpha + (\tilde{G}^{(2)})^\alpha,$$

with

$$(F^{(2)})^\alpha = \square_{g_b(2)} x^\alpha,$$

$$U_\alpha(G^{(2)})^\alpha = -s(1+b^{(2)})\partial_s\partial f^{(2)}\chi'(q),$$

$$L_\alpha(g^{(2)})^\alpha = \frac{1}{r}\Upsilon\left(\frac{r}{t}\right)\int_\infty^r\left(2(\partial_q\phi^{(2)})^2r-h^{(2)}(\theta,2t)\partial_q^2(q\chi(q))\right)dr,$$

$$\underline{L}_\alpha(G^{(2)})^\alpha = 0,$$

with $f^{(2)}$ such that $1+\partial_\theta f^{(2)} = (1+b^{(2)})^{-1}$, and $(\tilde{G}^{(2)})^\alpha$ contains the terms of the form $\tilde{g}^{(2)}\partial_s^l\partial_\theta^kb^{(2)}$, where $l+k-2 \geq 1$ or $l \geq 2$. Moreover $(g^{(2)}, \phi^{(2)})$ satisfy the same estimates than (g, ϕ) , $b^{(2)}$ satisfy the estimates \mathcal{H} and

$$\left\|\Pi Z^{N-5}\left(\int_0^\infty(\partial_q\phi^{(2)}(t,r,\theta))^2rdr+h^{(2)}(\theta,t)\right)\right\|_{L^2(\mathbb{S}^1)}\leq C\frac{\varepsilon^3}{\sqrt{1+t}}.$$

$$\left\|\Pi Z^{N-1}\left(\int_0^\infty(\partial_q\phi^{(2)}(t,r,\theta))^2rdr+h^{(2)}(\theta,t)\right)\right\|_{L^2(\mathbb{S}^1)}\leq C\frac{\varepsilon^3(1+t)^\rho}{\sqrt{1+t}}.$$

Proof of Theorem 1.12. We choose ε small enough such that

$$C\varepsilon^{\frac{1}{4}}\leq\frac{C_0}{2},\quad C\varepsilon\leq\frac{1}{2}$$

Then Propositions 3.2, 3.3 and 3.4 imply that the bootstrap assumptions for (ϕ, \tilde{g}) are true with the constant $2C_0$ replaced with $\frac{3C_0}{2}$. Moreover, thanks to Proposition 3.1, the bootstrap assumption 3.28 is true with $2C_0$ replaced by C_0 . Moreover, Propositions 3.5, 3.6 and 3.7 yield the existence of $b^{(2)}$ satisfying the hypothesis \mathcal{H} and $(g^{(2)} = g_{b^{(2)}} + \tilde{g}^{(2)}, \phi^{(2)})$ solution of (1.1) such that the bootstrap assumptions are satisfied by $(\tilde{g}^{(2)}, \phi^{(2)})$ with $2C_0$ replaced by $\frac{3C_0}{2}$, and the bootstrap assumptions (3.26), (3.27) and (3.28) are satisfied by

$$h^{(2)} = 2b_0(\theta+f^{(2)})+1-(1+b^{(2)})^2-2(1+b^{(2)})\partial_\theta\left(\frac{\partial_\theta b^{(2)}}{(1+b^{(2)})^2}\right)-(1+b^{(2)})(\partial_\theta b^{(2)})^2-2(1+b^{(2)})^{-2}(\partial_\theta b^{(2)})^2,$$

with $2C_0$ replaced by C_0 . This concludes the proof of Theorem 1.12. \square

3.3 First consequences of the bootstrap assumptions

Thanks to the weighted Klainerman-Sobolev inequality, the bootstrap assumptions immediately imply the following propositions

Proposition 3.8. *We have the estimates, for $q < R$*

$$|\partial Z^{N-3}\phi(t,x)|\lesssim\frac{\varepsilon}{\sqrt{1+|q|}\sqrt{1+s}},\tag{3.43}$$

$$|\partial Z^{N-5}\tilde{g}(t,x)|\lesssim\frac{\varepsilon(1+s)^\rho}{\sqrt{1+|q|}\sqrt{1+s}},\tag{3.44}$$

$$|\partial Z^{N-6}\tilde{g}_1(t,x)|\lesssim\frac{\varepsilon}{(1+|q|)^{\frac{1}{2}-\sigma}\sqrt{1+s}},\tag{3.45}$$

$$|\partial Z^{N-12}\tilde{g}_1(t,x)|\lesssim\frac{\varepsilon}{\sqrt{1+|q|}\sqrt{1+s}},\tag{3.46}$$

and for $q > R$

$$|\partial Z^{N-5}\tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{3}{2}+\delta}}, \quad (3.47)$$

$$|\partial Z^{N-6}\tilde{g}_1(t, x)| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}\sqrt{1+s}}. \quad (3.48)$$

Thanks to Lemma 1.10 we deduce the following corollary

Corollary 3.9. *We have the estimates, for $q < R$*

$$|Z^{N-3}\phi(t, x)| \lesssim \frac{\varepsilon\sqrt{1+|q|}}{\sqrt{1+s}}, \quad (3.49)$$

$$|\partial Z^{N-5}\tilde{g}(t, x)| \lesssim \frac{\varepsilon(1+s)^\rho\sqrt{1+|q|}}{\sqrt{1+s}}, \quad (3.50)$$

$$|\partial Z^{N-6}\tilde{g}_1(t, x)| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}+\sigma}}{\sqrt{1+s}}, \quad (3.51)$$

$$|\partial Z^{N-12}\tilde{g}_1(t, x)| \lesssim \frac{\varepsilon\sqrt{1+|q|}}{\sqrt{1+s}} \quad (3.52)$$

and for $q > R$

$$|\partial Z^{N-5}\tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{1}{2}+\delta}}, \quad (3.53)$$

$$|\partial Z^{N-6}\tilde{g}_1(t, x)| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}+\delta-\sigma}\sqrt{1+s}}. \quad (3.54)$$

To obtain L^2 estimates for $Z^I\phi$ and $Z^I\tilde{g}$ we may use the weighted Hardy inequality

Proposition 3.10. *We have*

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^N\phi\|_{L^2} + \|(1+|q|)^{-1}w^{\frac{1}{2}}(SZ^N\phi - s\partial_q\phi Z^N g_{LL})\|_{L^2} \lesssim \varepsilon(1+t)^\rho, \quad (3.55)$$

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^{N+1}\phi\|_{L^2} \lesssim \varepsilon(1+t)^{\frac{1}{2}+\rho}, \quad (3.56)$$

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^N\tilde{g}_1\|_{L^2} \lesssim \varepsilon(1+t)^\rho, \quad (3.57)$$

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^N\tilde{g}\|_{L^2} \lesssim \varepsilon(1+t)^{2\rho}, \quad (3.58)$$

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^{N-1}\phi\|_{L^2} \lesssim \varepsilon, \quad (3.59)$$

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^{N-3}\tilde{g}\|_{L^2} \lesssim \varepsilon(1+t)^\rho, \quad (3.60)$$

$$\|(1+|q|)^{-1}w^{\frac{1}{2}}Z^{N-4}\tilde{g}_1\|_{L^2} \lesssim \varepsilon. \quad (3.61)$$

Proof. The only thing we have to check is whether we can apply Proposition 1.8 with our weight functions. In the exterior, the smaller weight is $w_2(q) = (1+|q|)^\beta$ with $\beta = 2 + 2\delta - 2\sigma > 1$. In the interior, the biggest one is a $O(1)$. Consequently we are in the range the weighted of Hardy inequality. \square

Lemma 3.11. *We have*

$$\left\| \Pi Z^{N-1} \left(\int_0^\infty 2(\partial_q\phi(t, r, \theta))^2 r dr - h(\theta, 2t) \right) \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-2\rho}}, \quad (3.62)$$

$$\left\| \Pi Z^{N-5} \left(\int_0^\infty 2(\partial_q\phi(t, r, \theta))^2 r dr - h(\theta, 2t) \right) \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}}}. \quad (3.63)$$

Proof. We can write

$$(\partial_q \phi)^2 + \partial_r \phi \partial_t \phi = O(\partial \phi \bar{\partial} \phi).$$

Consequently, thanks to (3.1) and (1.7) we have

$$|(\partial_q \phi)^2 + \partial_r \phi \partial_t \phi| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^{I+1} \phi|,$$

and therefore

$$\begin{aligned} & \left\| \int ((\partial_q \phi)^2 + \partial_r \phi \partial_t \phi) r dr \right\|_{L^2(\mathbb{S}^1)} \\ & \lesssim \int \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \|Z^{I+1} \phi\|_{L^2(\mathbb{S}^1)} dr \\ & \lesssim \frac{\varepsilon}{(1+t)} \left\| \frac{Z^{I+1} \phi}{1+|q|} \right\|_{L^2}. \end{aligned}$$

Estimates 3.55 and (3.59) conclude the proof of Lemma 3.11. \square

4 The wave coordinates condition

4.1 Good components of the metric

The wave coordinates condition yields better decay properties in s for some components of the metric. Since far from a conical neighbourhood of the light cone, we have $|q| \sim s$, this condition will only be relevant near the light cone. It is given by

$$H^\alpha = g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha = F^\alpha + G^\alpha + \tilde{G}^\alpha,$$

where the terms are defined in Section 2.3.

Proposition 4.1. *We have the following estimate, in the region $\frac{t}{2} \leq r \leq 2t$,*

$$\left| Z^I \left(\partial_q \tilde{g}_{LL} - \frac{1}{r} \tilde{g}_{L\bar{L}} \right) \right| \lesssim |\bar{\partial} Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}| + \frac{1}{1+s} |Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}|$$

and

$$|\partial_q Z^I \tilde{g}_{LL}| \lesssim |\bar{\partial} Z^I \tilde{g}_{LL}| + |\bar{\partial} Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}| + \frac{1}{1+s} (|Z^I \tilde{g}_{L\bar{L}}| + |Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}|).$$

Let us note that the first part of the Proposition will only be used in Section 11.1.

Proof. The wave coordinate condition implies

$$\begin{aligned} -\underline{L}_\alpha H_b^\alpha &= \underline{L}_\alpha \left(\frac{1}{\sqrt{|\det(g)|}} \partial_\mu (g^{\mu\alpha} \sqrt{|\det(g)|}) \right) \\ &= \frac{g^{\mu\alpha}}{\sqrt{|\det(g)|}} \underline{L}_\alpha \partial_\mu \sqrt{|\det(g)|} + \partial_\mu (\underline{L}_\alpha g^{\mu\alpha}) - g^{\mu\alpha} \partial_\mu (\underline{L}_\alpha) \\ &= \frac{g^{\underline{L}\mu}}{\sqrt{|\det(g)|}} \partial_\mu \sqrt{|\det(g)|} + \partial_\mu (g^{\underline{L}\mu}) - \frac{1}{r} g^{UU} \\ &= \frac{g^{\underline{L}\underline{L}}}{\sqrt{|\det(g)|}} \partial_{\underline{L}} \sqrt{|\det(g)|} + \frac{g^{\underline{L}\mathcal{T}}}{\sqrt{|\det(g)|}} \partial_{\mathcal{T}} \sqrt{|\det(g)|} + \partial_{\underline{L}} g^{\underline{L}\underline{L}} + \partial_U g^{\underline{L}U} + \partial_L g^{\underline{L}L} \\ &\quad + \frac{1}{r} g^{\underline{L}R} - \frac{1}{r} g^{UU}, \end{aligned}$$

where we have denoted by R the vector field ∂_r , and used the following calculations

$$\begin{aligned} g^{\mu\alpha} \partial_\mu (\underline{L}_\alpha) &= -g^{\mu\alpha} \partial_\mu (R_\alpha) \\ &= -g^{11} \partial_1 \cos(\theta) - g^{12} (\partial_2 \cos(\theta) - \partial_1 \sin(\theta)) - g^{22} \partial_2 \sin(\theta) \\ &= -\frac{g^{UU}}{r}, \end{aligned}$$

$$\begin{aligned} \partial_\mu g^{\underline{L}\mu} &= \partial_0 g^{\underline{L}0} + \partial_1 g^{\underline{L}1} + \partial_2 g^{\underline{L}2} \\ &= \partial_0 g^{\underline{L}0} + \partial_R g^{\underline{L}R} + \partial_U g^{\underline{L}U} + g^{\underline{L}R} (\partial_1 \cos(\theta) + \partial_2 \sin(\theta)) + g^{\underline{L}U} (-\partial_1 \sin(\theta) + \partial_2 \cos(\theta)) \\ &= \partial_{\underline{L}} g^{\underline{L}\underline{L}} + \partial_U g^{\underline{L}U} + \partial_L g^{\underline{L}L} + \frac{g^{\underline{L}R}}{r}. \end{aligned}$$

Consequently

$$\begin{aligned} \partial_{\underline{L}} g^{\underline{L}\underline{L}} &= -\underline{L}_\alpha \left(F^\alpha + G^\alpha + \tilde{G}^\alpha \right) - \frac{g^{\underline{L}\underline{L}}}{\sqrt{|\det(g)|}} \partial_{\underline{L}} \sqrt{\det(g)} - \frac{g^{\underline{L}\tau}}{\sqrt{|\det(g)|}} \partial_\tau \sqrt{\det(g)} \\ &\quad - \partial_U g^{\underline{L}U} - \partial_L g^{\underline{L}L} - \frac{1}{r} g^{\underline{L}R} - \frac{1}{r} g^{UU}. \end{aligned} \tag{4.1}$$

Also we have

$$\det(g) = g_{LL}(g_{\underline{L}\underline{L}}g_{UU} - (g_{U\underline{L}})^2) - g_{L\underline{L}}(g_{\underline{L}\underline{L}}g_{UU} - g_{LU}g_{\underline{L}U}) + g_{LU}(g_{\underline{L}\underline{L}}g_{U\underline{L}} - g_{\underline{L}\underline{L}}g_{LU}).$$

Therefore

$$|\sqrt{|\det(g)|} - \sqrt{|\det(g_b)|} + \tilde{g}_{\underline{L}\underline{L}}| \lesssim |\tilde{g}_{\tau\tau}|.$$

We can express

$$\begin{aligned} g^{\underline{L}\underline{L}} &= \frac{1}{\det(g)} (g_{LL}g_{UU} - (g_{UL})^2) = -\frac{1}{4}g_{LL} + O(g_{\tau\tau})O(g), \\ g^{\underline{L}U} &= \frac{1}{\det(g)} (g_{\underline{L}\underline{L}}g_{LU} - g_{U\underline{L}}g_{LL}) = \frac{1}{2}g_{LU} + O(g_{\tau\tau})O(g), \\ g^{\underline{L}L} &= \frac{1}{\det(g)} (g_{\underline{L}\underline{L}}g_{UU} - g_{U\underline{L}}g_{UL}) = \frac{1}{g_{\underline{L}\underline{L}}} + O(g_{\tau\tau}), \end{aligned}$$

where we have used the notation $O(g) = O(g - m)$ where m is the Minkowski metric. We note that the terms involving $\partial_L g_{\underline{L}\underline{L}}$ compensate. Since in (4.1), by definition of F^α the terms involving only g_b compensate, we have

$$\left| \partial_q \tilde{g}_{LL} - \frac{1}{2r} \tilde{g}_{\underline{L}\underline{L}} \right| \lesssim |\bar{\partial} \tilde{g}_{\tau\tau}| + \frac{1}{1+s} |\tilde{g}_{\tau\tau}| + s.t..$$

where $s.t$ denotes similar terms (here these terms are quadratic terms with a better or similar decay), and we have used the fact that in the region $\frac{t}{2} \leq r \leq 2t$, we have $r \sim s$. Since $[Z, \partial_q] \sim \partial_q$ and $[Z, \bar{\partial}] \sim \bar{\partial}$ we have

$$|\partial_q Z^I \tilde{g}_{LL}| \lesssim |Z^{I-1} \tilde{g}_{LL}| + |\bar{\partial} Z^I \tilde{g}_{\underline{L}\underline{L}}| + |\bar{\partial} Z^I \tilde{g}_{\tau\tau}| + \frac{1}{1+s} (|Z^I \tilde{g}_{\underline{L}\underline{L}}| + |Z^I \tilde{g}_{\tau\tau}|).$$

and

$$\left| Z^I \left(\partial_q \tilde{g}_{LL} - \frac{1}{2r} \tilde{g}_{\underline{L}\underline{L}} \right) \right| \lesssim |\bar{\partial} Z^I \tilde{g}_{\tau\tau}| + \frac{1}{1+s} |Z^I \tilde{g}_{\tau\tau}|.$$

This concludes the proof of Proposition 4.1. \square

The other two contractions of the wave condition yield better decay on a conical neighbourhood of the light cone for \tilde{g}_{UL} and \tilde{g}_{UU} .

Proposition 4.2. *We have the following property*

$$\begin{aligned} |Z^I(\partial_q \tilde{g}_{UL} + G^U)| &\lesssim |\bar{\partial} Z^I \tilde{g}_{\mathcal{T}\mathcal{V}}| + \frac{1}{1+s} |Z^I \tilde{g}_{\mathcal{T}\mathcal{V}}|, \\ \left| Z^I \left(\partial_q \tilde{g}_{UU} - \frac{1}{2} G^L \right) \right| &\lesssim \sum |\bar{\partial} Z^I \tilde{g}| + \frac{1}{1+s} |Z^I \tilde{g}|. \end{aligned}$$

Proof. To obtain the first estimate, we contract the wave coordinate condition with the vector field U .

$$\begin{aligned} -U_\alpha H_b^\alpha &= \frac{1}{\sqrt{|\det(g)|}} U_\alpha \partial_\mu (g^{\mu\alpha}) \sqrt{\det(g)} \\ &= \frac{g^{\mu\alpha}}{\sqrt{|\det(g)|}} U_\alpha \partial_\mu \sqrt{|\det(g)|} + \partial_\mu (U_\alpha g^{\mu\alpha}) + g^{\mu\alpha} \partial_\mu (U_\alpha) \\ &= \frac{g^{U\mu}}{\sqrt{|\det(g)|}} \partial_\mu \sqrt{|\det(g)|} + \partial_\mu (g^{U\mu}) + \frac{1}{r} g^{UR} \\ &= \frac{g^{UL}}{\sqrt{|\det(g)|}} \partial_L \sqrt{|\det(g)|} + \frac{g^{U\mathcal{T}}}{\sqrt{|\det(g)|}} \partial_{\mathcal{T}} \sqrt{|\det(g)|} + \partial_L g^{UL} + \partial_U g^{UU} + \partial_L g^{UL} + \frac{1}{r} g^{UR}. \end{aligned}$$

Therefore

$$\partial_L g^{UL} = -U_\alpha H_b^\alpha - \frac{g^{UL}}{\sqrt{|\det(g)|}} \partial_L \sqrt{|\det(g)|} - \frac{g^{U\mathcal{T}}}{\sqrt{|\det(g)|}} \partial_{\mathcal{T}} \sqrt{|\det(g)|} - \partial_U g^{UU} - \partial_L g^{UL} - \frac{1}{r} g^{UR},$$

and arguing as in Proposition 4.1 we infer

$$|\partial_q \tilde{g}_{UL} + G^U| \lesssim |\bar{\partial} \tilde{g}_{\mathcal{T}\mathcal{V}}| + \frac{1}{1+s} |\tilde{g}_{\mathcal{T}\mathcal{V}}| + s.t.$$

Commuting with the vector fields Z as before, we obtain the desired estimate. To obtain the second one, we contract the wave coordinate condition with L

$$\begin{aligned} -L_\alpha H_b^\alpha &= \frac{1}{\sqrt{|\det g|}} L_\alpha \partial_\mu (g^{\mu\alpha}) \sqrt{|\det(g)|}. \\ &= \frac{1}{\sqrt{|\det g|}} \partial_L \left(\sqrt{|\det(g)|} g^{LL} \right) + \frac{1}{\sqrt{|\det g|}} \partial_{\mathcal{T}} \left(\sqrt{|\det(g)|} g^{L\mathcal{T}} \right) - g^{\mu\alpha} \partial_\mu (L_\alpha). \end{aligned} \tag{4.2}$$

We note that

$$\begin{aligned} \sqrt{|\det(g)|} g^{LL} &= -\frac{1}{\sqrt{|\det(g)|}} (g_{LL} g_{UU} - g_{UL} g_{UL}) \\ &= -\frac{g_{LL} g_{UU}}{\sqrt{g_{LL}^2 g_{UU} + O(\tilde{g}_{\mathcal{T}\mathcal{T}}) O(g)}} + O(\tilde{g}_{\mathcal{T}\mathcal{T}}) O(g) \\ &= \sqrt{g_{UU}} + O(\tilde{g}_{\mathcal{T}\mathcal{T}}) O(g). \end{aligned}$$

Therefore (4.2) yields

$$|\partial_q \tilde{g}_{UU} - \frac{1}{2} G^L| \lesssim |\bar{\partial} \tilde{g}| + \frac{1}{1+s} |\tilde{g}|.$$

We commute with the vector fields Z to conclude. □

4.2 Estimate for the good metric component g_{LL}

Thanks to the bootstrap assumptions, we obtain the following corollary.

Corollary 4.3. *We have the estimates for $q > R + 1$*

$$|\partial Z^{N-8} \tilde{g}_{LL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}+\delta-\sigma}} \quad (4.3)$$

and for $q \leq R + 1$

$$|\partial Z^{N-7} \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}+\sigma}}{(1+s)^{\frac{3}{2}}}, \quad (4.4)$$

$$|\partial Z^{N-7} \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}-\rho}}, \quad (4.5)$$

$$|\partial Z^{N-8} \tilde{g}_{LL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-3\rho}}, \quad (4.6)$$

$$|\partial Z^{N-10} \tilde{g}_{LL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}}. \quad (4.7)$$

Proof. Thanks to Proposition 4.1 we have

$$|\partial_q Z^I \tilde{g}_{LL}| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}_1|.$$

Then (3.54) yields (4.3), (3.51) yields (4.4), (3.50) yields (4.5), (3.4) yields (4.6) and (3.2) yields (4.7). \square

Thanks to Lemma 1.10, since $\delta - \sigma > \frac{1}{2}$ we obtain the following corollary

Corollary 4.4. *We have the estimates for $q > R + 1$*

$$|Z^{N-7} \tilde{g}_{LL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{-\frac{1}{2}+\delta-\sigma}}, \quad (4.8)$$

and for $q \leq R + 1$

$$|Z^{N-7} \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{3}{2}+\sigma}}{(1+s)^{\frac{3}{2}}}, \quad (4.9)$$

$$|Z^{N-7} \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{3}{2}}}{(1+s)^{\frac{3}{2}-\rho}}, \quad (4.10)$$

$$|Z^{N-8} \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-3\rho}}, \quad (4.11)$$

$$|Z^{N-10} \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-\rho}}. \quad (4.12)$$

We now give L^2 estimates for the coefficient g_{LL} .

Proposition 4.5. *We have*

$$\int_0^t \left\| w_2'(q)^{\frac{1}{2}} \partial Z^N \tilde{g}_{LL} \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1+t)^{2\rho}, \quad (4.13)$$

$$\int_0^t \left\| \frac{w_2'(q)^{\frac{1}{2}}}{(1+|q|)} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1+t)^{2\rho}, \quad (4.14)$$

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)} \partial Z^{N-1} \tilde{g}_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{1-\rho}}, \quad (4.15)$$

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)^2} Z^{N-1} \tilde{g}_{LL} \right\|_{L^2}^2 \lesssim \frac{\varepsilon}{(1+t)^{1-\rho}}, \quad (4.16)$$

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1+|q|)} \partial Z^{N-5} \tilde{g}_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{1-\rho}}, \quad (4.17)$$

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)^2} Z^{N-5} \tilde{g}_{LL} \right\|_{L^2}^2 \lesssim \frac{\varepsilon}{(1+t)^{1-\rho}}. \quad (4.18)$$

Moreover, the same statement holds true with w_2 replaced by w_1 and ρ replaced by 2ρ .

Proof. Proposition (4.1) implies

$$|\partial_q Z^N \tilde{g}_{LL}| \lesssim \frac{1}{1+s} |Z^I \tilde{g}_1| + |\bar{\partial} Z^N \tilde{g}_1|.$$

Thanks to (3.23) we have

$$\int_0^t \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1+t)^{2\rho},$$

and thanks to (3.57) we have

$$\begin{aligned} & \int_0^t \left\| \frac{w_2'(q)^{\frac{1}{2}}}{1+s} Z^N \tilde{g}_1 \right\|_{L^2}^2 ds \\ & \lesssim \int_0^t \frac{1}{(1+s)} \left\| \frac{w_2(q)^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g}_1 \right\|_{L^2}^2 ds \\ & \lesssim \int_0^t \frac{\varepsilon^2}{(1+s)^{1-2\rho}} \lesssim \varepsilon^2 (1+t)^{2\rho}, \end{aligned}$$

where we have used (3.57). This concludes the proof of estimate (4.13). To prove (4.14) we notice that thanks to the weighted Hardy inequality

$$\left\| \frac{w_2'(q)^{\frac{1}{2}}}{(1+|q|)} Z^N \tilde{g}_{LL} \right\|_{L^2} \lesssim \left\| w_2'(q)^{\frac{1}{2}} \partial Z^N \tilde{g}_{LL} \right\|_{L^2}.$$

Indeed in the exterior $w_2'(q) = (1+|q|)^\beta$ with $\beta = 1 + 2\delta - 4\sigma > 1$, and in the interior, $w_2'(q) = (1+|q|)^\alpha$ with $\alpha = -1 - 2\sigma - 1 < 1$. To prove (4.15) we write

$$|\partial_q Z^I \tilde{g}_{LL}| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}_1|,$$

and consequently

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)} \partial Z^{N-1} \tilde{g}_{LL} \right\|_{L^2} \lesssim \frac{1}{1+t} \left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)} Z^N \tilde{g}_1 \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}},$$

where we have used (3.57). To prove (4.16) we notice that thanks to the weighted Hardy inequality

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)^2} Z^{N-1} \tilde{g}_{LL} \right\|_{L^2} \lesssim \left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)} \partial Z^{N-1} \tilde{g}_{LL} \right\|_{L^2}^2.$$

Indeed in the exterior $\frac{w_2}{(1+|q|)^2} = (1+|q|)^\beta$ with $\beta = 2\delta - 4\sigma > 1$, and in the interior, $\frac{w_2}{(1+|q|)^2} = (1+|q|)^\alpha$ with $\alpha = -1 - 2\sigma - 2 < 1$. Estimates (4.17) and (4.18) are proved in the same way thanks to (3.61). \square

The outgoing null cone

Proposition 4.6. *For ε small enough, the causal future of $B(0, R)$ is included in the Minkowski cone $q < R + \frac{1}{2}$.*

Proof. With our estimates for g , we obtain that the outgoing solution of the eikonal equation

$$g^{\alpha\beta} \partial_\alpha u \partial_\beta u,$$

with initial data $u = r$ is such that

$$\partial_s u = O(g_{LL}) = O\left(\frac{\varepsilon q}{(1+s)^{\frac{3}{2}-\rho}}\right),$$

so

$$u = q(1 + O(\varepsilon)).$$

The causal future of $B(0, R)$ is the inside of the cone bounded by the hypersurface $u = R$. So in the causal future of $B(0, R)$ we have

$$q \leq R(1 + \varepsilon) \leq R + \frac{1}{2}.$$

\square

As a consequence, ϕ is supported in the region $q < R + \frac{1}{2}$.

4.3 Estimate for the good metric coefficient g_{UL}

We recall the definition of G^U

$$G^U = \sigma_{UL}^0 \chi'(q).$$

The following estimate for G^U is a direct consequence of (2.24).

Proposition 4.7. *We have*

$$|Z^{N-11} G^U| \lesssim \frac{\varepsilon^2 \mathbb{1}_{R+\frac{1}{2} \leq q \leq R+1}}{1+s}. \quad (4.19)$$

We now go to the estimate of g_{UL} .

Corollary 4.8. *We have the estimates for $q > R + 1$*

$$|\partial Z^I \tilde{g}_{UL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{\frac{1}{2}+\delta}} \quad (4.20)$$

and for $q \leq R + 1$

$$|\partial_q Z^{N-7} g_{UL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}-\rho}}, \quad (4.21)$$

$$|\partial_q Z^{N-8} g_{UL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-3\rho}}, \quad (4.22)$$

$$|\partial_q Z^{N-10} g_{UL}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}}. \quad (4.23)$$

Proof. In the exterior, $G^U = 0$ so thanks to Proposition 4.2 we have

$$|\partial Z^I \tilde{g}_{UL}| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}|,$$

and (4.20) is a consequence of (3.53). In the interior Proposition 4.2 yields

$$|Z^I (\partial_q (\tilde{g}_{UL} + \sigma_{UL}^0 \chi(q)))| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}|.$$

We can write $\tilde{g}_{LU} + \chi(q) \sigma_{UL}^0 = g_{UL} - \chi(q) \sigma_{UL}^1$ so thanks to (2.23) for $I \leq N - 2$

$$|\partial_q Z^I g_{UL}| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}| + \mathbb{1}_{q>R} |Z^I \sigma_{UL}^1| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}| + \frac{\varepsilon^2}{(1+s)^{\frac{7}{4}}}.$$

Consequently (3.50) yields (4.21), (3.4) yields (4.22) and (3.2) yields (4.23). \square

By integrating, we obtain the following corollary

Corollary 4.9. *We have the estimates for $q > R + 1$*

$$|Z^{N-7} \tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{-\frac{1}{2}+\delta}} \quad (4.24)$$

and for $q \leq R + 1$

$$|Z^{N-7} (\tilde{g}_{UL} - (1 - \chi(q)) \sigma_{UL}^0)| \lesssim \frac{\varepsilon(1+|q|)^{\frac{3}{2}}}{(1+s)^{\frac{3}{2}-\rho}}, \quad (4.25)$$

$$|Z^{N-8} (\tilde{g}_{UL} - (1 - \chi(q)) \sigma_{UL}^0)| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-3\rho}}, \quad (4.26)$$

$$|Z^{N-10} (\tilde{g}_{UL} - (1 - \chi(q)) \sigma_{UL}^0)| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-\rho}}, \quad (4.27)$$

$$|Z^{N-11} \tilde{g}_{UL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}+\rho}}{1+s}. \quad (4.28)$$

Proof. By integrating (4.20) in the exterior, since $\delta > \frac{1}{2}$, we obtain (4.24). For $I \leq N - 7$, we have

$$|\partial_q (Z^I \tilde{g}_{UL} + \chi(q) \sigma_{UL}^0)| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}-\rho}},$$

and consequently

$$|\partial_q(Z^I \tilde{g}_{UL} + (\chi(q) - 1)\sigma_{UL}^0)| \lesssim \frac{\varepsilon(1 + |q|)^{\frac{1}{2}}}{(1 + s)^{\frac{3}{2} - \rho}}. \quad (4.29)$$

For $q = R + 1$ we can estimate, thanks to (4.24) and the fact that $\chi(q) - 1 = 0$,

$$|Z^I(\tilde{g}_{UL} + (\chi(q) - 1)\sigma_{UL}^0)| \lesssim \frac{\varepsilon}{(1 + s)^{\frac{3}{2}}}.$$

Consequently, integrating (4.29) from $q = R + 1$ yields (4.25). We obtain (4.26) and (4.27) in the same way. Estimate (4.28) is a direct consequence of (4.27) and (2.24). \square

We now give the L^2 estimates for the good coefficient of the metric

Proposition 4.10. *We have*

$$\int_0^t \left\| w_2'(q)^{\frac{1}{2}} \partial_q Z^N (\tilde{g}_{UL} + \chi(q)\sigma_{UL}^0) \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1 + t)^{2\rho}, \quad (4.30)$$

$$\int_0^t \left\| \frac{w_2'(q)^{\frac{1}{2}}}{1 + |q|} \partial_q Z^N (\tilde{g}_{UL} + \chi(q)\sigma_{UL}^0) \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1 + t)^{2\rho}, \quad (4.31)$$

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1 + |q|)} \partial_q Z^{N-1} (\tilde{g}_{UL} + \chi(q)\sigma_{UL}^0) \right\|_{L^2} \lesssim \frac{\varepsilon}{(1 + t)^{1-\rho}}, \quad (4.32)$$

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1 + |q|)^{\frac{1}{4} + \sigma}} \partial_q Z^{N-1} \tilde{g}_{UL} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1 + t)^{\frac{1}{4}}}, \quad (4.33)$$

$$\left\| \frac{w_2(q)^{\frac{1}{2}}}{(1 + |q|)^2} Z^{N-1} (\tilde{g}_{UL} + (1 - \chi(q))\sigma_{UL}^0) \right\|_{L^2}^2 \lesssim \frac{\varepsilon}{(1 + t)^{1-\rho}}, \quad (4.34)$$

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1 + |q|)^{\frac{5}{4} + \sigma}} Z^{N-1} \tilde{g}_{UL} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1 + t)^{\frac{1}{4}}}. \quad (4.35)$$

Proof. Thanks to Proposition 4.2 we have

$$|\partial_q Z^N (\tilde{g}_{UL} + \chi(q)\sigma_{UL}^0)| \lesssim |\bar{\partial} Z^N \tilde{g}_1| + \frac{1}{1 + s} |Z^N \tilde{g}_1|.$$

Thanks to (3.23) we have

$$\int_0^t \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1 + t)^{2\rho},$$

and thanks to (3.58) we have

$$\begin{aligned} & \int_0^t \left\| \frac{w_2'(q)^{\frac{1}{2}}}{1 + s} Z^N \tilde{g}_1 \right\|_{L^2}^2 ds \\ & \lesssim \int_0^t \frac{1}{(1 + s)} \left\| \frac{w_2(q)^{\frac{1}{2}}}{1 + |q|} Z^N \tilde{g}_1 \right\|_{L^2}^2 ds \\ & \lesssim \int_0^t \frac{\varepsilon^2}{(1 + s)^{1-2\rho}} \lesssim \varepsilon^2 (1 + t)^{2\rho}, \end{aligned}$$

which concludes the proof of (4.30). Then (4.16) is a consequence of (4.30) and Hardy inequality. To prove (4.30) we write

$$|\partial_q Z^{N-1}(\tilde{g}_{UL} + \chi(q)\sigma_{UL}^0)| \lesssim \frac{1}{1+s} |Z^N \tilde{g}_1|,$$

so (4.30) is a direct consequence of (3.58). We prove (4.33). We have

$$\|\chi'(q)Z^{N-1}\sigma_{UL}^0\|_{L^2}^2 \lesssim \int \chi'(q)^2 \|s\partial_s Z^{N-1}b\|_{L^2(\mathbb{S}^1)}^2 r dr \lesssim \frac{\varepsilon^4}{(1+s)^{\frac{1}{2}}},$$

and thanks to (3.58)

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{4}+\sigma}(1+s)} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{1}{(1+t)^{\frac{1}{4}+\sigma}} \left\| \frac{w_1(q)^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{4}}}.$$

This concludes the proof of (4.33). Estimates (4.34) and (4.35) are a direct consequence of the weighted Hardy inequality and (4.32) and (4.33). \square

4.4 Estimates for the good metric coefficient g_{UU}

4.4.1 Estimates for G^L

Proposition 4.11. *We have the estimates*

$$\|rZ^{N-5}G^L\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h, \quad (4.36)$$

$$\|rZ^{N-1}G^L\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-\rho}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h + \frac{\varepsilon\sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)}, \quad (4.37)$$

$$\|rZ^N G^L\|_{L^2(\mathbb{S}^1)} \lesssim \varepsilon^2(1+t)^\rho + \Delta_h, \quad (4.38)$$

$$\int_0^t (1+\tau) \|r\partial_s Z^N G^L\|_{L^2(\mathbb{S}^1)}^2 d\tau \lesssim \varepsilon^2(1+t)^{2\rho} + \Delta_h. \quad (4.39)$$

Proof. We have

$$G^L = \frac{1}{r} \Upsilon \left(\frac{r}{t} \right) \int_\infty^r (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr.$$

Thanks to Proposition 4.6 we have $\phi = 0$ for $q \geq R + \frac{1}{2}$ so $G^L = 0$ for $q > R + 1$, and we have

$$G^L = \frac{1}{r} \Upsilon \left(\frac{r}{t} \right) \left(\int_\infty^0 2(\partial_q \phi)^2 r dr + h(\theta, 2t) + \int_0^r (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr \right).$$

We have the estimate, thanks to (3.27) (more precisely thanks to Lemma 3.11)

$$\|rG^L\|_{H^{N-5}(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} + \Delta_h + \Upsilon \left(\frac{r}{t} \right) \int_0^r \left(\|(\partial_q \phi)^2\|_{H^{N-5}(\mathbb{S}^1)} r + \|h(\theta, 2t)\|_{H^{N-5}(\mathbb{S}^1)} \partial_q^2(q\chi(q)) \right) dr.$$

We estimate

$$\begin{aligned} \int_0^r \|(\partial_q \phi)^2\|_{H^I(\mathbb{S}^1)} r dr &\lesssim \int_0^r \|\partial_\theta^{\frac{I}{2}} \partial_q \phi\|_{L^\infty(\mathbb{S}^1)} \|\partial_q \phi\|_{H^I(\mathbb{S}^1)} r dr \\ &\lesssim \int_0^r \frac{\varepsilon r}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)} \\ &\lesssim \varepsilon \|\partial_q Z^I \phi\|_{L^2} \left(\int_0^r \frac{1}{(1+|q|)^{3-8\rho}} dr \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon}{(1+|q|)^{1-4\rho}} \|\partial_q Z^I \phi\|_{L^2} \end{aligned}$$

where we have used (3.1) to estimate

$$|\partial_\theta^{\frac{I}{2}} \partial_q \phi| \lesssim \frac{1}{1+|q|} |Z^{\frac{I}{2}+1} \phi| \lesssim \frac{\varepsilon^2}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}},$$

for $\frac{I}{2} \leq \frac{N}{2} \leq N-9$. We obtain

$$\|rG^L\|_{H^{N-5}(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} + \Delta_h + \Upsilon\left(\frac{r}{t}\right) \frac{\varepsilon}{(1+|q|)^{1-4\rho}} \|\partial_q Z^I \phi\|_{L^2} + \Upsilon\left(\frac{r}{t}\right) \|Z^{N-5} b(\theta, t)\|_{H^2(\mathbb{S}^1)} \mathbb{1}_{q>R},$$

and so thanks to (3.13) and (2.3)

$$\|rG^L\|_{H^{N-5}(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h \quad (4.40)$$

Similarly, thanks to (3.26) we have

$$\|rG^L\|_{H^{N-1}(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-\rho}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h \quad (4.41)$$

and thanks to (3.9) and (2.5)

$$\|rG^L\|_{H^I(\mathbb{S}^1)} \lesssim \varepsilon^2(1+t)^\rho. \quad (4.42)$$

We now look at the derivatives with respect to r and t .

$$\begin{aligned} \partial_r G^L &= O\left(\frac{1}{1+s} G^L\right) + \Upsilon\left(\frac{r}{t}\right) 2(\partial_q \phi)^2 - \Upsilon\left(\frac{r}{t}\right) \frac{h(\theta, 2t) \partial_q^2(q\chi(q))}{r}, \\ \partial_t G^L &= O\left(\frac{1}{1+s} G^L\right) + \frac{1}{r} \Upsilon\left(\frac{r}{t}\right) \int_\infty^r \partial_t (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr \\ &= O\left(\frac{1}{1+s} G^L\right) + \frac{1}{r} \Upsilon\left(\frac{r}{t}\right) \int_\infty^r (2\partial_s - \partial_r) (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr \\ &= O\left(\frac{1}{1+s} G^L\right) - \Upsilon\left(\frac{r}{t}\right) 2(\partial_q \phi)^2 + \Upsilon\left(\frac{r}{t}\right) \frac{h(\theta, 2t) \partial_q^2(q\chi(q))}{r} \\ &\quad + \frac{1}{r} \Upsilon\left(\frac{r}{t}\right) \int_\infty^r 2\partial_s (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr. \end{aligned}$$

Consequently we have

$$\begin{aligned} \partial_q G^L &= \Upsilon\left(\frac{r}{t}\right) 2(\partial_q \phi)^2 - \Upsilon\left(\frac{r}{t}\right) \frac{h(\theta, 2t) \partial_q^2(q\chi(q))}{r} \\ &\quad + O\left(\frac{1}{1+s} G^L\right) - \frac{2}{r} \Upsilon\left(\frac{r}{t}\right) \int_\infty^r \partial_s (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr, \\ \partial_s G^L &= O\left(\frac{1}{1+s} G^L\right) + \frac{2}{r} \Upsilon\left(\frac{r}{t}\right) \int_\infty^r \partial_s (2(\partial_q \phi)^2 r - h(\theta, 2t) \partial_q^2(q\chi(q))) dr. \end{aligned} \quad (4.43)$$

We calculate

$$\begin{aligned} \partial_s(r(\partial_q \phi)^2) &= 2r \partial_q \phi \partial_s \partial_q \phi + \frac{1}{2} (\partial_q \phi)^2 \\ &= \frac{1}{2} \partial_q \square \phi - \partial_q \phi \left(\partial_s \phi + \frac{1}{r} \partial_\theta^2 \phi \right) \\ &= \frac{1}{2} \partial_q \phi \left((\square \phi - \square_g \phi) r - \partial_s \phi - \frac{1}{r} \partial_\theta^2 \phi \right). \end{aligned}$$

We have

$$Z^I(\partial_q \phi \partial_s \phi) = \sum_{I_1+I_2 \leq I} \partial_q Z^{I_1} \phi \bar{\partial} Z^{I_2} \phi,$$

If $I_1 \leq \frac{N}{2} \leq N - 10$ we estimate thanks to (3.1) and (1.7)

$$|\partial_q Z^{I_1} \phi| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}},$$

and if $I_2 \leq \frac{N}{2} \leq N - 10$ we estimate

$$|\bar{\partial} Z^{I_2} \phi| \lesssim \frac{1}{1+s} |Z^{I_2+1} \phi| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}-4\rho}(1+s)^{\frac{3}{2}}},$$

and so

$$|Z^I(\partial_q \phi \partial_s \phi)| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}} |\bar{\partial} Z^I \phi| + \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}-4\rho}(1+s)^{\frac{3}{2}}} |\partial Z^I \phi|.$$

We estimate $Z^I(\partial_q \phi \frac{1}{r} \partial_\theta^2 \phi)$ in the same way. For the estimate of $Z^I(\square \phi - \square_q \phi)$ we refer to Proposition 5.2. We obtain

$$\begin{aligned} |Z^I \partial_s(r(\partial_q \phi)^2)| &\lesssim \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}} |\bar{\partial} Z^{I+1} \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |\partial Z^I \phi| \\ &\quad + \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{3}{2}-4\rho}} \left(\frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} |Z^I \tilde{g}_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I \tilde{g}| \right. \\ &\quad \left. + \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}}} |\partial Z^{I+1} \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| + \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} Z^I \phi| \right). \end{aligned}$$

We estimate, for $I \leq N - 1$

$$\begin{aligned} \int \left\| \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}} \bar{\partial} Z^{I+1} \phi \right\|_{L^2(\mathbb{S}^1)} dr &\lesssim \int \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{3}{2}}} \|Z^{I+2} \phi\|_{L^2(\mathbb{S}^1)} dr \\ &\lesssim \left\| \frac{w}{1+|q|} Z^{I+2} \phi \right\|_{L^2} \left(\int \frac{\varepsilon}{(1+s)^4(1+|q|)^{1-8\rho}} dr \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon}{(1+s)^{2-5\rho}} \left\| \frac{w}{1+|q|} Z^{I+2} \phi \right\|_{L^2}, \end{aligned}$$

and for $I \leq N$,

$$\begin{aligned} \int \left\| \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}} \bar{\partial} Z^{I+1} \phi \right\|_{L^2(\mathbb{S}^1)} dr &\lesssim \frac{\varepsilon}{(1+s)} \|w'(q) \bar{\partial} Z^{I+1} \phi\|_{L^2} \\ \int \left\| \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} \partial Z^I \phi \right\|_{L^2(\mathbb{S}^1)} dr &\lesssim \frac{\varepsilon}{(1+s)^{2-5\rho}} \|\partial Z^I \phi\|_{L^2}, \\ \int \left\| \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{3}{2}-\rho}} \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} Z^I \tilde{g}_{LL} \right\|_{L^2(\mathbb{S}^1)} dr & \\ \lesssim \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^I \tilde{g}_{LL} \right\|_{L^2} \left(\int \frac{\varepsilon^2}{(1+s)(1+|q|)^{4-10\rho-4\sigma}} \right)^{\frac{1}{2}} & \\ \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}}} \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^I \tilde{g}_{LL} \right\|_{L^2}, & \end{aligned}$$

$$\begin{aligned} \int \left\| \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{3}{2}-4\rho}} \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}}} \partial Z^{I+1} \phi \right\|_{L^2(\mathbb{S}^1)} dr &\lesssim \int \|\partial Z^{I+1} \phi\|_{L^2} \left(\int \frac{\varepsilon^2}{(1+s)^3(1+|q|)^{2-8\rho}} dr \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} \|\partial Z^{I+1} \phi\|_{L^2}, \end{aligned}$$

$$\int \left\| \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{3}{2}-4\rho}} \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} Z^I G^L \right\|_{L^2} dr \lesssim \frac{\varepsilon}{(1+s)^2} \sup_{r \in \mathbb{R}} \|r Z^I G^L\|_{L^2(\mathbb{S}^1)}.$$

Consequently we can estimate for $I \leq N-1$

$$\begin{aligned} &\left\| Z^I \int_{\infty}^r \partial_s ((\partial_q \phi)^2 r - h(\theta, s) \partial_q^2(q\chi(q))) dr \right\| \\ &\lesssim \frac{\varepsilon}{(1+s)^{2-5\rho}} \left\| \frac{w^{\frac{1}{2}}}{1+|q|} Z^{I+2} \phi \right\|_{L^2} + \frac{\varepsilon}{(1+s)^{2-5\rho}} \|\partial Z^I \phi\|_{L^2} + \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}}} \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^I \tilde{g}_{LL} \right\|_{L^2} \\ &+ \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} \|\partial Z^{I+1} \phi\|_{L^2} + \frac{\varepsilon}{(1+s)^2} \sup_{r \in \mathbb{R}} \|r Z^I G^L\|_{L^2(\mathbb{S}^1)} + \|\partial_s Z^I h\|_{L^2(\mathbb{S}^1)}, \end{aligned}$$

and therefore, for $I \leq N-5$, thanks to (3.59), (3.13), (4.18) and (2.4) we have

$$\|r(s \partial_s Z^{N-5} G^L)\|_{L^2(\mathbb{S}^1)} \lesssim \|r Z^I G^L\|_{L^2(\mathbb{S}^1)} + \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}}}. \quad (4.44)$$

For $I \leq N-2$, thanks to (3.55), (3.9), (4.16) and (2.4) we have

$$\|r(s \partial_s Z^{N-2} G^L)\|_{L^2(\mathbb{S}^1)} \lesssim \|r Z^I G^L\|_{L^2(\mathbb{S}^1)} + \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}-\rho}}, \quad (4.45)$$

and for $I \leq N-1$, thanks to (3.56), we have

$$\|r(s \partial_s Z^{N-1} G^L)\|_{L^2(\mathbb{S}^1)} \lesssim \|r Z^I G^L\|_{L^2(\mathbb{S}^1)} + \frac{\varepsilon^2}{(1+s)^{\frac{1}{4}}}. \quad (4.46)$$

Moreover, for $I \leq N$ we have

$$\begin{aligned} \|r(\partial_s Z^N G^L)\|_{L^2(\mathbb{S}^1)} &\lesssim \frac{1}{1+s} \|r Z^N G^L\|_{L^2(\mathbb{S}^1)} + \frac{\varepsilon}{1+s} \|w'(q) \bar{\partial} Z^{N+1} \phi\|_{L^2} \\ &+ \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}}} \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^N \tilde{g}_{LL} \right\|_{L^2} + \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} \|\partial Z^{N+1} \phi\|_{L^2} + \|\partial_s Z^N h\|_{L^2(\mathbb{S}^1)}. \end{aligned} \quad (4.47)$$

We now estimate

$$\begin{aligned} &r q \left\| Z^I \left(\Upsilon \left(\frac{r}{t} \right) 2(\partial_q \phi)^2 - \Upsilon \left(\frac{r}{t} \right) \frac{h(\theta, 2t) \partial_q^2(q\chi(q))}{r} \right) \right\|_{L^2(\mathbb{S}^1)} \\ &\lesssim \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)} + \mathbb{1}_{R < q < R+1} \|Z^I h\|_{L^2(\mathbb{S}^1)}. \end{aligned} \quad (4.48)$$

Consequently we have proved, for $I \leq N - 6$, thanks to (4.40), (4.44) and (4.48)

$$\begin{aligned} \|rZ^{I+1}G^L\|_{L^2(\mathbb{S}^1)} &\lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h + \|rZ^I G^L\|_{L^2(\mathbb{S}^1)} \\ &\quad + \frac{\varepsilon\sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)} + \mathbb{1}_{R < q < R+1} \|Z^I h\|_{L^2(\mathbb{S}^1)}, \end{aligned}$$

and by recurrence

$$\|rZ^{N-5}G^L\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h + \frac{\varepsilon\sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)}. \quad (4.49)$$

In the same way, thanks to (4.41), (4.45) and (4.48) we obtain

$$\|rZ^{N-1}G^L\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-2\rho}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \Delta_h + \frac{\varepsilon\sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)}. \quad (4.50)$$

Thanks to (4.42), (4.48) and (4.46) we obtain

$$\|rZ^N G^L\|_{L^2(\mathbb{S}^1)} \lesssim \varepsilon^2(1+t)^\rho. \quad (4.51)$$

Moreover, thanks to (4.47) we obtain

$$\begin{aligned} \int_0^t (1+\tau) \|r\partial_s Z^N G^L\|_{L^2(\mathbb{S}^1)}^2 d\tau &\lesssim \int_0^t \frac{\varepsilon^2}{(1+\tau)^{1-\rho}} + \frac{\varepsilon}{1+\tau} \|w'(q)\bar{\partial}Z^{N+1}\phi\|_{L^2}^2 d\tau \\ &\quad + \int_0^t \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 + (1+\tau) \|\partial_s Z^N h\|_{L^2(\mathbb{S}^1)}^2 d\tau \end{aligned}$$

and consequently

$$\int_0^t (1+\tau) \|r\partial_s Z^N G^L\|_{L^2(\mathbb{S}^1)} d\tau \lesssim \varepsilon^2(1+t)^\rho.$$

□

4.4.2 Estimates for g_{UV}

Corollary 4.12. *We have the estimates for $q > R + 1$*

$$|\partial Z^{N-7} \tilde{g}_{UV}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{\frac{1}{2}+\delta}} \quad (4.52)$$

and for $q \leq R + 1$

$$|\partial_q Z^{N-7} \tilde{g}_{UV}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}-\rho}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}}, \quad (4.53)$$

$$|\partial_q Z^{N-8} \tilde{g}_{UV}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-3\rho}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}}, \quad (4.54)$$

$$|\partial_q Z^{N-10} \tilde{g}_{UV}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}}. \quad (4.55)$$

Proof. Thanks to Proposition 4.2 we have

$$|\partial_q Z^I \tilde{g}_{UU}| \lesssim \frac{1}{1+s} |Z^{I+1} \tilde{g}| + |Z^I G^L|.$$

Consequently, (3.53) yields (4.52). Thanks to (4.36), the Sobolev embedding $H^1(\mathbb{S}^1) \subset L^\infty$ and the estimate (3.28) for Δ_h we obtain

$$|Z^{N-6} G^L| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}}. \quad (4.56)$$

Consequently (3.50) yields (4.53), (3.4) yields (4.54) and (3.2) yields (4.55). \square

Thanks to Lemma 1.10, since $\delta - \sigma > \frac{1}{2}$ we obtain the following corollary

Corollary 4.13. *We have the estimates for $q > R+1$*

$$|Z^{N-7} \tilde{g}_{UU}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{-\frac{1}{2}+\delta}} \quad (4.57)$$

and for $q \leq R+1$

$$|Z^{N-7} \tilde{g}_{UU}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{3}{2}}}{(1+s)^{\frac{3}{2}-\rho}} + \frac{\varepsilon(1+|q|)^{4\rho}}{(1+s)}, \quad (4.58)$$

$$|Z^{N-8} \tilde{g}_{UU}| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-3\rho}} + \frac{\varepsilon(1+|q|)^{4\rho}}{(1+s)}, \quad (4.59)$$

$$|Z^{N-10} \tilde{g}_{UU}| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-\rho}} + \frac{\varepsilon(1+|q|)^{4\rho}}{(1+s)}. \quad (4.60)$$

We now give the L^2 estimates for \tilde{g}_{UU} .

Proposition 4.14. *We have*

$$\int_0^t (1+\tau)^{-2\rho} \left\| w_1'(q)^{\frac{1}{2}} \partial Z^N \tilde{g}_{UU} \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1+t)^{2\rho} \quad (4.61)$$

$$\int_0^t (1+\tau)^{-2\rho} \left\| \frac{w_1'(q)^{\frac{1}{2}}}{1+|q|} \partial Z^N \tilde{g}_{UU} \right\|_{L^2}^2 ds \lesssim \varepsilon^2 (1+t)^{2\rho} \quad (4.62)$$

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}+\sigma}} \partial Z^{N-1} \tilde{g}_{UU} \right\|_{L^2}^2 \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}}}, \quad (4.63)$$

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}+\sigma}} Z^I \tilde{g}_{UU} \right\|_{L^2}^2 \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}}}. \quad (4.64)$$

Proof. Thanks to Proposition 4.2 we have

$$|\partial_q Z^N \tilde{g}_{UU}| \lesssim |\bar{\partial} Z^N \tilde{g}| + \frac{1}{1+s} |Z^N \tilde{g}| + |Z^N G^L|.$$

We estimate

$$\begin{aligned} \int_0^t (1+\tau)^{-2\rho} \left\| w_1'(q)^{\frac{1}{2}} Z^N G^L \right\|_{L^2}^2 &\lesssim \int_0^t (1+\tau)^{-2\rho} \int \frac{1}{(1+|q|)^{1+2\sigma} r^2} \|r Z^N G^L\|_{L^2(\mathbb{S}^1)}^2 dr dt \\ &\lesssim \int_0^t \varepsilon^2 (1+\tau)^{-1} \\ &\lesssim \varepsilon^2 (1+t)^{2\rho}. \end{aligned}$$

This estimate together with (3.25) yield (4.61). Then the weighted Hardy inequality yields (4.62). Thanks to Proposition 4.2 we have

$$|\partial_q Z^{N-1} \tilde{g}_{UU}| \lesssim \frac{1}{1+s} |Z^N \tilde{g}| + |Z^{N-1} G^L|.$$

We can estimate

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}+\sigma}} Z^{N-1} G^L \right\|_{L^2}^2 \lesssim \int \frac{1}{(1+|q|)^{1+\sigma}(1+s)} \|r Z^{N-1} G^L\|_{L^2}^2 \lesssim \frac{\varepsilon^2}{1+t},$$

and

$$\left\| \frac{w_1(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}+\sigma}(1+s)} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{1}{(1+t)^{\frac{1}{2}+\sigma}} \left\| w_1(q)^{\frac{1}{2}} 1 + |q| Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}}},$$

where we have used (3.58), which concludes the proof of (4.63). We obtain (4.64) thanks to (4.63) and the weighted Hardy inequality. \square

By taking at each time the minimum of the estimates from Corollary 4.4, 4.9 and 4.13, and estimating $Z^{N-7} \sigma_{UL}^0 = O\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{4}}}\right)$ thanks to (2.22) we obtain the following

Corollary 4.15. *We have the estimates for $q > R+1$*

$$|Z^{N-7} \tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{\delta-\frac{1}{2}}}, \quad (4.65)$$

ad for $q \leq R+1$

$$|Z^{N-7} \tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{3}{4}+\rho}}{(1+s)^{\frac{3}{4}}}, \quad (4.66)$$

$$|Z^{N-8} \tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{4}+3\rho}}{(1+s)^{\frac{3}{4}}}, \quad (4.67)$$

$$|Z^{N-10} \tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{4}+\rho}}{(1+s)^{\frac{3}{4}}}, \quad (4.68)$$

$$|Z^{N-11} \tilde{g}_{\mathcal{T}\mathcal{T}}| + (1+|q|)|\partial_q Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{(1+|q|)^{\frac{1}{2}+\rho}}{(1+s)}. \quad (4.69)$$

5 Structure of the equations

Proposition 5.1. *We can write $\square_g Z^I g_{\mu\nu} = Z^I R_{\mu\nu}^1 + {}^I M_{\mu\nu} + {}^I M_{\mu\nu}^E + {}^I Q_{\mu\nu}$, where R^1 is given by Proposition 2.3, and*

$$\begin{aligned} |{}^I M| &\lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |\partial Z^I \phi| + \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |\bar{\partial} Z^I \phi| \\ &+ \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^I \tilde{g}| + \frac{1}{1+s} |Z^I \tilde{g}| \right) \\ &+ \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial Z^I \tilde{g}| + \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} |Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}| + \frac{1}{1+s} |Z^I G| + |\bar{\partial} Z^I G| \\ &+ \varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \right) \left(|\bar{\partial} Z^I \tilde{g}_1| + \frac{1}{1+|q|} |Z^I g_{LL}| \right) \end{aligned}$$

${}^I M_{\mu\nu}^E$ is non zero only in the exterior region $q > R$ and we have

$$\begin{aligned} |{}^I M^E| &\lesssim \frac{\varepsilon}{(1+s)} \left(|\bar{\partial} Z^I \tilde{g}| + \frac{|q|}{1+s} |\partial Z^I \tilde{g}| + \frac{1}{1+s} |Z^I \tilde{g}| + \frac{1}{1+|q|} |\tilde{g}_{\mathcal{T}\mathcal{T}}| \right) \\ &\quad + \frac{\varepsilon}{(1+s)(1+|q|)^{2+\delta-\rho}} \left(s |\partial_s Z^I b| + q |\partial_s \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_\theta^2 b| \right) \\ &\quad + \min \left(\frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}}, \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}(1+s)^{\frac{1}{2}}} \right) \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| \right. \\ &\quad \left. + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right) \end{aligned}$$

${}^I Q$ is such that

$${}^I Q_{\mathcal{T}\mathcal{T}} = 0, \quad {}^I Q_{\underline{L}\underline{L}} = \partial_{\underline{L}} \tilde{g}_{\underline{L}\underline{L}} \partial_L Z^I \tilde{g}_{\underline{L}\underline{L}}, \quad {}^I Q_{UL} = \partial_{\underline{L}} \tilde{g}_{\underline{L}\underline{L}} (\partial_U \tilde{g}_{\underline{L}\underline{L}} + \partial_L (\tilde{g}_{UL} + \sigma_{UL}^0)),$$

and the new contributions involved in ${}^I Q_{\underline{L}\underline{L}}$ (defined in (3.8)) are

$$\begin{aligned} |{}^I Q_{\underline{L}\underline{L}}| &\lesssim \frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^I \tilde{g}_1| + \frac{1}{1+|q|} |Z^I g_{\underline{L}\underline{L}}| \right) + \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| \\ &\quad + \varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \right) (|\bar{\partial} Z^I \tilde{g}| + |Z^I G^L|) \\ &\quad + \mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{5}{2}+\delta}}, \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{5}{2}+\delta+\sigma}} \right) \frac{q}{s} |Z^I \partial_\theta^2 b| + \mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}_1| \\ &\quad + \mathbb{1}_{q>R} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right). \end{aligned}$$

Proof. The quadratic terms in $\square_g Z^I g_{\mu\nu}$ are of the form

$$A_{--} = m^{--} m^{--} \partial_- Z^{I_1} g_{--} \partial_- Z^{I_2} g_{--}$$

or

$$B_{--} = m^{--} m^{--} Z^{I_1} (g - m)_{--} \partial_- \partial_- Z^{I_2} g_{--}$$

with $I_1 + I_2 \leq I$.

The case $\mathcal{T}\mathcal{T}$. In this case there can not be more than two occurrences of the vector field \underline{L} . In $A_{\mathcal{T}\mathcal{T}}$: the terms involving two bad derivative are of the form

$$\partial_q Z^{I_1} g_{\mathcal{T}\mathcal{T}} \partial_q Z^{I_2} g_{\mathcal{T}\mathcal{T}}.$$

We may assume $I_1 \leq I_2$. We estimate first

$$\partial_q Z^{I_1} \tilde{g}_{\mathcal{T}\mathcal{T}} \partial_q Z^{I_2} \tilde{g}_{\mathcal{T}\mathcal{T}}.$$

Thanks to (4.69), since $I_1 \leq \frac{N}{2} \leq N - 11$ this is bounded by

$$\frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} |\partial_q Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}|.$$

Thanks to Proposition (4.2) this term is bounded by

$$\frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^I \tilde{g}| + \frac{1}{1+s} |Z^I \tilde{g}| \right), \quad (5.1)$$

$$+ \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} |Z^I G|. \quad (5.2)$$

We estimate

$$\partial_q Z^{I_1} (g_b)_{\tau\tau} \partial_q Z^{I_2} \tilde{g}_{\tau\tau}.$$

This term is only present in the exterior and thanks to (2.24) this is bounded by

$$\mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)} \left(|\bar{\partial} Z^I \tilde{g}| + \frac{1}{1+s} |Z^I \tilde{g}| \right), \quad (5.3)$$

$$+ \mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)} |Z^I G|. \quad (5.4)$$

We now estimate

$$\partial_q Z^{I_1} \tilde{g}_{\tau\tau} \partial_q Z^{I_2} (g_b)_{\tau\tau}.$$

This term is only present in the exterior and is bounded by

$$\mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)(1+|q|)^{1+\delta-\rho}} \frac{1}{1+|q|} \left(s |\partial_s Z^I b| + q |\partial_s \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_\theta^2 b| \right), \quad (5.5)$$

where we have estimated $\partial_q Z^{I_1} \tilde{g}_{\tau\tau}$ with (4.65) in the region $q > R + 1$ and (4.69) in the region $R \leq q \leq R + 1$, and we have estimated $\partial_q Z^{I_2} (g_b)_{\tau\tau}$ with (2.20) and (2.18). The terms involving only the metric g_b are all taken into account in the Ricci tensor of g_b .

We decompose the terms of the form $\bar{\partial} Z^{I_1} g \partial_q Z^{I_2} g$, with $I_1 \leq I_2$ in three part

$$\bar{\partial} Z^{I_1} \tilde{g} \partial_q Z^{I_2} \tilde{g}, \quad \bar{\partial} Z^{I_1} \tilde{g} \partial_q Z^{I_2} g_b, \quad \bar{\partial} Z^{I_1} g_b \partial_q Z^{I_2} \tilde{g}.$$

They can be estimated respectively by

$$\frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial_q Z^I \tilde{g}|, \quad (5.6)$$

$$\mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho} (1+|q|)^{\frac{1}{2}+\delta}} \frac{1}{1+|q|} \left(s |\partial_s Z^I b| + q |\partial_s \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_\theta^2 b| \right), \quad (5.7)$$

$$\mathbb{1}_{q>R} \frac{\varepsilon(1+|q|)}{(1+s)^2} |\partial_q Z^{I_2} \tilde{g}|, \quad (5.8)$$

where in (5.6) we have used

$$|\bar{\partial} Z^{I_1} \tilde{g}| \lesssim \frac{1}{1+s} |Z^{I_1+1} \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}},$$

thanks to (3.2). In (5.7) we have used

$$|\bar{\partial} Z^{I_1} \tilde{g}| \lesssim \frac{1}{1+s} |Z^{I_1+1} \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho} (1+|q|)^{\frac{1}{2}+\delta}},$$

thanks to (3.51), and we have estimated $\partial_q Z^{I_2} g_b$ thanks to (2.18), and (2.20). In (5.8) we have estimated

$$|\bar{\partial} Z^{I_1} g_b| \lesssim \frac{1}{1+s} |Z^{I_1+1} g_b| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^2},$$

thanks to (2.24).

The remaining terms are of one of the following form

$$\partial_{\underline{L}} Z^{I_1} g_{\underline{L}\mathcal{T}} \bar{\partial} Z^{I_2} g_{\mathcal{T}\mathcal{T}}, \quad \partial_{\underline{L}} Z^{I_1} g_{\mathcal{T}\mathcal{T}} \bar{\partial} Z^{I_2} g_{\underline{L}\mathcal{T}}.$$

We estimate the first one, beginning with $\partial_q Z^{I_1} \tilde{g}_{\underline{L}\mathcal{T}} \bar{\partial} Z^{I_2} \tilde{g}_{\mathcal{T}\mathcal{T}}$ with $I_1 \leq I_2$: it can be estimated in two different way, according that we use (3.2) or (3.46)

$$\frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} |\bar{\partial} Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}|, \quad (5.9)$$

$$\frac{\varepsilon}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} |\bar{\partial} Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}|. \quad (5.10)$$

The term $\partial_{\underline{L}} Z^{I_1} (g_b)_{\underline{L}\mathcal{T}} \bar{\partial} Z^{I_2} \tilde{g}_{\mathcal{T}\mathcal{T}}$ give the contribution (5.3) and (5.4). The term $\partial_{\underline{L}} Z^{I_1} \tilde{g}_{\underline{L}\mathcal{T}} \bar{\partial} Z^{I_2} g_b$ gives the contribution

$$\mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}}, \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}(1+s)^{\frac{1}{2}}} \right) \\ \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + |\partial_s \partial_\theta Z^I b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right), \quad (5.11)$$

where we have estimated $\partial_q Z^{I_1} \tilde{g}_{\underline{L}\mathcal{T}}$ thanks to (3.54) or (3.53), and we have estimated $\bar{\partial} Z^{I_2} g_b$ thanks to (2.21). Thanks to the estimates (4.69) and (4.65) the term $\partial_{\underline{L}} Z^{I_1} g_{\mathcal{T}\mathcal{T}} \bar{\partial} Z^{I_2} g_{\underline{L}\mathcal{T}}$ can be estimated by (5.1), (5.3) and (5.5).

We now estimate $B_{\mathcal{T}\mathcal{T}}$. First we note that with our gauge condition, the terms involving $\partial^2 Z^I \tilde{g}$ are absent. We note that there are no terms involving $\partial_s^3 \partial_\theta Z^I b$, $\partial_s^3 Z^I b$ or $\partial_\theta^4 Z^I b$. The reason for this is the following : the terms involving two derivatives of g^0 in the Ricci tensor of g are the same as the terms involving two derivatives of g^0 for a metric of the form $h = g^0 + c$ where c is a quadratic form with constant coefficients. However, the metric h and g^0 are isometric, so h is Ricci flat. Therefore in the Ricci tensor of g , there are no terms involving two derivatives of g^0 .

The terms in $Z^{I_1} (g - m) \partial^2 Z^{I_2} g$, with $I_1 \leq I_2 < I$ give similar contribution than the terms in $A_{\mathcal{T}\mathcal{T}}$, noticing that

$$|\bar{\partial} \partial Z^{I_2} g| \lesssim \frac{1}{1+s} |\partial Z^{I_2+1} g|, \quad |\partial^2 Z^{I_2} g| \lesssim \frac{1}{1+|q|} |\partial Z^{I_2+1} g|.$$

The terms of the form $(\partial \bar{\partial} Z^{I_1} g) Z^{I_2} g$, with $I_1 \leq I_2$ give contributions

$$\frac{\varepsilon}{(1+|q|)(1+s)^{\frac{3}{2}-\rho}} |Z^{I_2} \tilde{g}|, \quad (5.12)$$

$$+ \mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)^2} |Z^{I_2} \tilde{g}|, \quad (5.13)$$

or (5.7). The other terms are of the form $\partial_q^2 Z^{I_1} g_{\mathcal{T}\mathcal{T}} Z^{I_2} g_{\mathcal{T}\mathcal{T}}$. They give contributions

$$\frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} |Z^{I_2} \tilde{g}_{\mathcal{T}\mathcal{T}}|, \quad (5.14)$$

$$\mathbb{1}_{q>0} \frac{\varepsilon}{(1+s)(1+|q|)} |Z^{I_2} \tilde{g}_{\mathcal{T}\mathcal{T}}|, \quad (5.15)$$

or (5.5). We now estimate the terms involving G : they are

$$Z^I (G^\alpha \partial_\alpha g_{\mathcal{T}\mathcal{T}}), \quad Z^I (g_{\mathcal{T}\alpha} \partial_{\mathcal{T}} G^\alpha).$$

They give contributions

$$\frac{1}{1+s}|Z^I G| + |\bar{\partial} Z^I G| \quad (5.16)$$

$$\frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}}} \left(\bar{\partial} Z^I \tilde{g}_{\tau\tau} + \frac{1}{1+s} Z^I \tilde{g}_{\tau\tau} \right), \quad (5.17)$$

where we have used the estimates (4.19) and (4.56) to estimate $Z^{I_1} G$ for $I_1 \leq \frac{N}{2}$.

The case $L\bar{L}$ We now turn to $A_{L\bar{L}}$. The new terms are those who contain three times a \bar{L} vector field : they must also contain three times a L vector field. They are of the form

$$Z^I(\partial_{\bar{L}} g_{\bar{L}L} \partial_{\bar{L}} g_{LL}), \quad Z^I(\partial_{\bar{L}} g_{\bar{L}L} \partial_L g_{\bar{L}L}), \quad Z^I(\partial_{\bar{L}} g_{\bar{L}L} \partial_L g_{LL}) \quad Z^I(\partial_L g_{\bar{L}L} \partial_L g_{\bar{L}L}).$$

We treat the first term. Thanks to Proposition 4.1, $Z^I(\partial_{\bar{L}} \tilde{g}_{\bar{L}L} \partial_{\bar{L}} \tilde{g}_{LL})$ is equivalent to

$$Z^I(\partial \tilde{g}_1 \bar{\partial} \tilde{g}_1),$$

and consequently gives (5.6), or either (5.9) or (5.10). The term $\partial_{\bar{L}} Z^{I_1}(g_b)_{\bar{L}L} \partial_{\bar{L}} Z^{I_2} g_{LL}$ with $I_1 \leq I_2$ gives (5.3), $\partial_{\bar{L}} Z^{I_1}(g_b)_{\bar{L}L} \partial_{\bar{L}} Z^{I_2} g_{LL}$ with $I_2 \leq I_1$ gives (5.7). The term $\partial_{\bar{L}} Z^{I_1}(\tilde{g})_{\bar{L}L} \partial_{\bar{L}} Z^{I_2}(g_b)_{LL}$ with $I_1 \leq I_2$ gives, thanks to the estimate (2.19) on σ_{LL}^1

$$\mathbb{1}_{q>R} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta} s^{\frac{1}{2}-\rho}} \frac{1}{1+|q|} \left(|\partial_s Z^I b| + \frac{q}{s} |\partial_s \partial_\theta Z^I b| + \frac{q^2}{s^2} |\partial_\theta Z^I b| \right) \quad (5.18)$$

and the term $\partial_{\bar{L}} Z^{I_1} \tilde{g}_{\bar{L}L} \partial_{\bar{L}} Z^{I_2}(g_b)_{LL}$ with $I_2 \leq I_1$ gives (5.8). The second term give contributions similar to the first term, except for $\partial_{\bar{L}} \tilde{g}_{\bar{L}L} \partial_L(g_b)_{LL}$ which give (5.11). We treat the third term. The terms $\bar{\partial} Z^{I_1} g_{LL} \partial_q Z^{I_2} g_{\bar{L}L}$ with $I_1 \leq I_2$ give contributions (5.6), (5.7) and (5.8). The term $\partial_L Z^{I_1} g_{LL} \partial_{\bar{L}} Z^{I_2} g_{\bar{L}L}$, with $I_1 \leq I_2 < I$ is estimated by

$$\frac{1}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^I g_{LL}|. \quad (5.19)$$

The term $\partial_{\bar{L}} \tilde{g}_{\bar{L}L} \partial_L Z^I \tilde{g}_{LL}$ is in ${}^I Q_{L\bar{L}}$, and it can be estimated by

$$\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)} |\bar{\partial} Z^I \tilde{g}_{LL}|. \quad (5.20)$$

The term $\partial_{\bar{L}} Z^{I_1} \tilde{g}_{\bar{L}L} \partial_L Z^{I_2} \tilde{g}_{LL}$ can be (roughly) estimated by (5.11), thanks to the estimate (2.19) on σ_{LL}^1 . The forth term give contributions (5.6), (5.7) and (5.8). We turn to $B_{L\bar{L}}$. The new terms are of the form

$$\partial_{\bar{L}L} Z^{I_1} g_{\bar{L}L} Z^{I_2} g_{LL}, \quad \partial_{\bar{L}L} Z^{I_1} g_{LL} Z^{I_2} g_{\bar{L}L},$$

with $I_1 \leq I_2$. The term $\partial_{\bar{L}L} Z^{I_1} \tilde{g}_{\bar{L}L} Z^{I_2} \tilde{g}_{LL}$ gives contributions either

$$\frac{\varepsilon}{(1+|q|)^2(1+s)^{\frac{1}{2}-\rho}} |Z^I \tilde{g}_{LL}| \quad (5.21)$$

or

$$\frac{\varepsilon}{(1+|q|)^{\frac{3}{2}}(1+s)^{\frac{1}{2}}} |Z^I \tilde{g}_{LL}| \quad (5.22)$$

according that we estimate \tilde{g}_{LL} with (3.2) or (3.45). The crossed terms give contributions (5.15) or (5.18). The second term give contributions (5.12), (5.13) or (5.7). We now estimate the terms involving G :

$$Z^I(G^\tau \partial_\tau g_{L\bar{L}}), \quad Z^I(g_{L\tau} \partial_L G^\tau) \quad Z^I(g_{L\tau} \partial_{\bar{L}} G^\tau).$$

They give contributions (5.1), (5.16) or (5.17), where we note that

$$|\partial_q Z^I G| \lesssim \frac{1}{1+|q|} |Z^I G| + |\bar{\partial} Z^I G|.$$

The case $U\bar{L}$ The new terms contain three times the vector field \bar{L} , so they contain twice the vector field L and once the vector field U . The term containing two derivatives $\partial_{\bar{L}}$ are of the form

$$Z^I(\partial_{\bar{L}}g_{LU}\partial_{\bar{L}}g_{\bar{L}L}), \quad Z^I(\partial_{\bar{L}}g_{LL}\partial_{\bar{L}}g_{U\bar{L}}).$$

The second term can be estimated in the same way than $Z^I(\partial_{\bar{L}}g_{LL}\partial_{\bar{L}}g_{\bar{L}L})$ in the case $L\bar{L}$. We now treat the first term. We consider $Z^I(\partial_{\bar{L}}g_{LU}\partial_{\bar{L}}\tilde{g}_{\bar{L}L})$. We decompose it in

$$Z^I(\partial_{\bar{L}}(\tilde{g}_{LU} + \sigma_{LU}^0)\partial_{\bar{L}}\tilde{g}_{\bar{L}L}) + Z^I(\partial_{\bar{L}}(\sigma_{LU}^1)\partial_{\bar{L}}\tilde{g}_{\bar{L}L}).$$

Thanks to the Proposition 4.2 the first term is equivalent to $Z^I(\bar{\partial}\tilde{g}\partial_{\bar{L}}\tilde{g}_{\bar{L}L})$ and gives contributions (5.6) or either (5.9) or (5.10). The second terms give contributions (5.18) or (5.8). The term $Z^I(\partial_{\bar{L}}\tilde{g}_{LU}\partial_{\bar{L}}(g_b)_{\bar{L}L})$ gives contribution (5.3), (5.4) and (5.5). The new terms involving a good derivative are the following (with $I_1 \leq I_2$)

$$\partial_{\bar{L}}Z^{I_1}\tilde{g}_{\bar{L}L}\partial_{\bar{T}}Z^{I_2}g_{\bar{T}T}, \quad \partial_{\bar{L}}Z^{I_1}\tilde{g}_{\bar{L}T}\partial_{\bar{T}}Z^{I_2}g_{\bar{L}T}, \quad \partial_{\bar{L}}Z^{I_1}\tilde{g}_{\bar{T}T}\partial_{\bar{T}}Z^{I_2}g_{\bar{L}L}.$$

The third term can be bounded by (5.1). The first gives the contribution (5.20). The second term consist of

$$\partial_{\bar{L}}\tilde{g}_{\bar{L}L}\partial_U\tilde{g}_{\bar{L}L}, \quad \partial_{\bar{L}}\tilde{g}_{\bar{L}L}\partial_L(\tilde{g}_{U\bar{L}} + \sigma_{U\bar{L}}^0), \quad \partial_{\bar{L}}\tilde{g}_{\bar{L}L}\bar{\partial}\sigma_{\bar{T}T}^1.$$

The first two are in ${}^I Q_{U\bar{L}}$. They can be estimated by

$$\varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{\sqrt{1+s}\sqrt{1+|q|}} \right) |\bar{\partial}Z^I\tilde{g}|, \quad (5.23)$$

$$\mathbb{1}_{q>R} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} \left(s|\partial_s^2 Z^I b| + q|\partial_s^2 \partial_{\theta} Z^I b| + \frac{q}{s}|Z^I \partial_s \partial_{\theta}^2 b| + |\partial_s \partial_{\theta} Z^I b| + \frac{q}{s^2}|Z^I \partial_{\theta}^3 b| \right). \quad (5.24)$$

The third can be estimated (loosely) by (5.11). We turn to $B_{\bar{L}U}$. The new terms are of the form

$$\partial_{\bar{L}}\partial_{\bar{L}}Z^{I_1}g_{U\bar{L}}Z^{I_2}g_{\bar{L}L}, \quad \partial_{\bar{L}}\partial_{\bar{L}}Z^{I_1}(g_b)_{\bar{L}L}Z^{I_2}\tilde{g}_{U\bar{L}}, \quad \partial_{\bar{L}}\partial_{\bar{L}}Z^{I_1}(g_b)_{U\bar{L}}Z^{I_2}\tilde{g}_{\bar{L}L}.$$

The first two terms can be estimated by (5.21) or (5.22), (5.18) and (5.15). The last term would not have enough decay, but it is actually not present : such a term could only come from $g_{UU}\partial_{\bar{L}}H^U$, and more precisely from $\partial_{\bar{L}}\tilde{G}^U$. However, according to the definition of \tilde{G}^U , this term do not contain terms in $\partial_{\bar{L}}g_b$.

We now look at the terms involving G . They are of the form

$$Z^I(G^{\bar{T}}\partial_{\bar{T}}g_{U\bar{L}}), \quad Z^I(g_{\bar{T}U}\partial_{\bar{L}}G^{\bar{T}}), \quad Z^I(g_{\bar{T}\bar{L}}\partial_U G^{\bar{T}}).$$

Let's look at the order one term in G . They are of the form

$$Z^I(\partial_{\bar{L}}G^U), \quad Z^I(\partial_U G^{\bar{L}}).$$

The first term has been introduced to compensate the bad component $R_{U\bar{L}}^0$ of the Ricci tensor of g_b . The second term gives a contribution which is (5.16). The quadratic terms give the same contributions as in the $L\bar{L}$ case.

The case \underline{LL} We look at the term involving two bad derivatives. They are of the form

$$Z^I(\partial_{\underline{L}}g_{\underline{LL}}\partial_{\underline{L}}g_{\underline{LL}}), \quad Z^I(\partial_{\underline{L}}g_{\underline{LL}}\partial_{\underline{L}}g_{\underline{LL}}), \quad Z^I(\partial_{\underline{L}}g_{\underline{UU}}\partial_{\underline{L}}g_{\underline{LL}}), \quad Z^I(\partial_{\underline{L}}g_{\underline{UL}}\partial_{\underline{L}}g_{\underline{UL}}).$$

Using Proposition (4.1), the first term can be estimated by

$$|\partial_{\underline{L}}Z^{I_1}g_{\underline{LL}}| \left(|\bar{\partial}Z^{I_2}g_{\mathcal{T}\mathcal{T}}| + \frac{1}{1+s}|Z^{I_2}\tilde{g}| + |Z^{I_2}\sigma_{\underline{LL}}^1| \right)$$

so this gives contribution (5.9), (5.13) and (5.18). The term $Z^I(\partial_{\underline{L}}g_{\underline{LL}}\partial_{\underline{L}}g_{\underline{LL}})$ would come from $P_{\underline{LL}}$. We can check that it is not present. The third term is in ${}^I Q_{\underline{LL}}$. Thanks to the wave coordinate condition, it is composed of

$$Z^I(G^L\partial_{\underline{L}}g_{\underline{LL}}) \quad Z^I(\bar{\partial}\tilde{g}\partial_{\underline{L}}g_{\underline{LL}}) \quad Z^I(\partial_{\underline{L}}(g_b)_{UU}\partial_{\underline{L}}\tilde{g}_{\underline{LL}}).$$

They give contributions

$$\min \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}}, \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial\tilde{g}_1|, \quad (5.25)$$

$$\varepsilon \min \left(\frac{1}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)}, \frac{1}{\sqrt{1+s}\sqrt{1+|q|}} \right) (|Z^I G| + |\bar{\partial}Z^I\tilde{g}|), \quad (5.26)$$

$$\mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{3}{2}+\delta}}, \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}+\delta-\sigma}} \right) \frac{1}{1+|q|} \left(|\partial_s Z^I b| + \frac{q}{s} |\partial_s \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_\theta^2 b| \right), \quad (5.27)$$

$$\mathbb{1}_{q>0} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}_2| \quad (5.28)$$

or (5.23). The fourth term is equivalent to the term $Z^I(\partial_{\underline{L}}g_{\underline{UL}}\partial_{\underline{L}}g_{\underline{LL}})$ which has already been treated in the case \underline{UL} .

We go to $B_{\underline{LL}}$. The new terms are of the form

$$\partial_{\underline{L}}\partial_{\underline{L}}Z^{I_1}g_{\underline{LL}}Z^{I_2}g_{\underline{LL}}, \quad \partial_{\underline{L}}\partial_{\underline{L}}Z^{I_1}(g_b)_{\underline{LL}}Z^{I_2}g_{\underline{LL}}, \quad \partial_{\underline{L}}\partial_{\underline{L}}Z^{I_1}(g_b)_{\underline{UU}}Z^{I_2}g_{\underline{LL}}.$$

The first one is in ${}^I Q_{\underline{LL}}$ and gives a contribution (5.21) or (5.18). The second term would come from $\tilde{g}_{\underline{LL}}\partial_{\underline{L}}F^L$, but (see the analysis of the wave coordinate condition), in F^L , there is only one order one term involving a derivative \underline{L} which is $\partial_{\underline{L}}g_{\underline{UU}}$, consequently the second term is not present. The third one is in $Q_{\underline{LL}}$ and give a contribution in (5.27) and (5.28). We go to the term with G , they are

$$Z^I(G^{\mathcal{T}}\partial_{\mathcal{T}}g_{\underline{LL}}), \quad Z^I(g_{\underline{L}\mathcal{T}}\partial_{\underline{L}}G^{\mathcal{T}}),$$

We calculate $\partial_q G^L$ thanks to (4.43)

$$\partial_q G^L = \frac{1}{r}G^L + 2(\partial_q \phi)^2 + \frac{\partial_q^2(q\chi(q))}{r}h(\theta, 2t) + \partial_s G^L.$$

The terms $(\partial_q \phi)^2 + \frac{\partial_q^2(q\chi(q))}{r}h$ are here to compensate the term $(\partial_q \phi)^2$ and the bad component $R_{\underline{LL}}^0$ of the Ricci tensor of g_b . Let us note that this term is actually $\frac{\partial_q^2(q\chi(q))}{r}h(\theta, s)$. However we have

$$\frac{\partial_q^2(q\chi(q))}{r}(h(\theta, s) - h(\theta, 2t)) = \frac{\partial_q^2(q\chi(q))}{r}O(\partial_s h),$$

so we can neglect this term, compared to the terms which are already present in R^1 . The terms which remain give contributions (5.25), (5.3), and (5.26). \square

We now give a similar result for ϕ .

Proposition 5.2. *We have*

$$\begin{aligned} |\square_g Z^I \phi| &\lesssim \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} |Z^I \tilde{g}_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I \tilde{g}_1| + \frac{\varepsilon}{(1+s)^{\frac{5}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I \tilde{g}| \\ &\quad + \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial Z^I \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| + \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} Z^I \phi|. \end{aligned}$$

Proof. First we note that since ϕ is supported in $q < R + \frac{1}{2}$, the support of ϕ and the support of $g_b - m$ are disjoint, consequently the support of ϕ and the support of F , \tilde{G} and G^U are also disjoint. Therefore we have

$$\square_g \phi = g^{\alpha\beta} \partial_\alpha \partial_\beta \phi + 2G^L \partial_s \phi.$$

Consequently $\square_g Z^I \phi$ is composed of terms

$$Z^{I_1} \tilde{g}_{LL} \partial_q^2 Z^{I_2} \phi, \quad Z^{I_1} \tilde{g}_{TV} \partial_q \bar{\partial} Z^{I_2} \phi, \quad Z^{I_1} \tilde{g}_{LL} \partial_s^2 Z^{I_2} \phi, \quad Z^{I_1} G^L \partial_s Z^{I_2} \phi,$$

with $I_1 + I_2 = I$ and $I_2 < I$. Therefore (3.1), (3.2) and (4.56) yield the estimate of Proposition 5.2. \square

6 Angle and linear momentum

The aim of this section is to prove Proposition 3.1. For this, we separate in $R_{\mu\nu}$ the linear terms in g and G from the quadratic terms, which are the same as the quadratic terms in $\square g_{\mu\nu}$. We denote by $\tilde{\Gamma}$ the part of the Christoffel symbol of g which involve derivatives of \tilde{g} . We note $O((\partial g)^2)$ the quadratic terms : they are determined in Proposition 5.1.

$$\begin{aligned} R_{00} &= (R_b)_{00} + \partial_0 \tilde{\Gamma}_{00}^0 + \partial_i \tilde{\Gamma}_{00}^i - \partial_0 \tilde{\Gamma}_{00}^0 - \partial_0 \tilde{\Gamma}_{0i}^i + O((\partial g)^2) \\ &= (R_b)_{00} + \partial_i \tilde{\Gamma}_{00}^i - \partial_0 \tilde{\Gamma}_{0i}^i + O((\partial g)^2), \\ R_{ii} &= (R_b)_{ii} + \partial_0 \tilde{\Gamma}_{ii}^0 + \partial_j \tilde{\Gamma}_{ii}^j - \partial_i \tilde{\Gamma}_{i0}^0 - \partial_i \tilde{\Gamma}_{ij}^j + O((\partial g)^2). \end{aligned}$$

We note that

$$-\partial_0 \tilde{\Gamma}_{0i}^i + \partial_0 \tilde{\Gamma}_{ii}^0 = -2\partial_0 \partial_i g_{i0} + O((\partial g)^2).$$

Consequently

$$2((\partial_t \phi)^2 + |\nabla \phi|^2) = (R_b)_{00} + (R_b)_{11} + (R_b)_{22} + \partial_i \tilde{\Gamma}_{00}^i + \partial_j \tilde{\Gamma}_{ii}^j - \partial_i \tilde{\Gamma}_{i0}^0 - \partial_i \tilde{\Gamma}_{ij}^j - 2\partial_i \partial_0 g_{i0} + O((\partial g)^2). \quad (6.1)$$

Moreover we have

$$(R_b)_{00} + (R_b)_{11} + (R_b)_{22} = \frac{2}{r} \partial_q^2 (q\chi(q)) h(\theta, s) + O\left(\frac{\varepsilon^2}{r^2} \mathbb{1}_{R \leq q \leq R+1}\right).$$

We note that when $R \leq q \leq R+1$ we can write $h(\theta, s) = h(\theta, 2t) + O\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}}\right)$. Consequently, if we integrate (6.1) over \mathbb{R}^2 we obtain

$$\int (\partial_t \phi)^2 + |\nabla \phi|^2 = \int h(\theta, 2t) d\theta + O\left(\frac{\varepsilon^2}{1+t}\right) + \int O((\partial g)^2).$$

We calculate

$$R_{0i} = (R_b)_{0i} + \partial_0 \tilde{\Gamma}_{0i}^0 + \partial_j \tilde{\Gamma}_{0i}^j - \partial_0 \tilde{\Gamma}_{0i}^0 - \partial_0 \tilde{\Gamma}_{ji}^j + O((\partial g)^2),$$

and consequently

$$2\partial_t\phi\partial_1\phi = -\frac{\cos(\theta)}{r}\partial^2(q\chi(q))h(\theta, s) + \partial_q^2\chi(q)\sigma_{UL}^0\sin(\theta) + O\left(\frac{\varepsilon^2}{r^2}\mathbb{1}_{R\leq q\leq R+1}\right) + \partial_j\tilde{\Gamma}_{01}^j - \partial_0\partial_1\tilde{g}_{jj} + O((\partial g)^2). \quad (6.2)$$

By integrating (6.2) over \mathbb{R}^2 we obtain

$$2\int\partial_t\phi\partial_1\phi = -\int\cos(\theta)h(\theta, 2t)d\theta + O\left(\frac{\varepsilon^2}{(1+t)}\right) + \int O((\partial g)^2).$$

Moreover, thanks to Proposition 5.1] the quadratic terms in $\square g_{\mu\nu}$ can be bounded by

$$\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-2\rho}},$$

(see also the proof of Proposition 7.1 for more details). Consequently we have

$$\Delta_h = O\left(\frac{\varepsilon^2}{(1+s)^{\frac{1}{2}}}\right).$$

7 L^∞ estimates

7.1 Estimate for $I \leq N - 9$

Proposition 7.1. *We have the estimates for $I \leq N - 9$*

$$\begin{aligned} |Z^I\tilde{g}| &\leq \frac{C_0\varepsilon + C\varepsilon^2}{(1+s)^{\frac{1}{2}-\rho}}, \\ |Z^I\phi| &\leq \frac{C_0\varepsilon + C\varepsilon^2}{\sqrt{1+s}(1+|q|)^{\frac{1}{2}-4\rho}}. \end{aligned}$$

This proposition is a consequence of the following propositions.

Proposition 7.2. *We have the estimate for $I \leq N - 9$*

$$|\square Z^I\phi| \lesssim \frac{\varepsilon^2}{(1+s)^{2-3\rho}(1+|q|)}, \quad q < R+1,$$

and $\square Z^I\phi = 0$ for $q > R+1$.

Proposition 7.3. *We have the estimate for $I \leq N - 9$ and $q > R$*

$$|\square Z^I\tilde{g}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho-\sigma}},$$

and for $q < R$

$$|\square Z^I\tilde{g}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)}.$$

Remark 7.4. *The estimate in the region $q > R$ is not sharp for the decay in q .*

The following lemma is a direct consequence of the $L^\infty - L^\infty$ estimate and is proved at the end of the section.

Lemma 7.5. *Let $\beta, \alpha \geq 0$, such that $\beta - \alpha \geq \rho > 0$. Let u be such that*

$$|\Box u| \lesssim \frac{1}{(1+s)^{\frac{3}{2}-\alpha}(1+|q|)}, \text{ for } q < 0 \quad |\Box u| \lesssim \frac{1}{(1+s)^{\frac{3}{2}-\alpha}(1+|q|)^{1+\beta}}, \text{ for } q > 0,$$

and $(u, \partial_t u)|_{t=0} = 0$. Then we have the estimate

$$|u| \lesssim \frac{(1+t)^{\alpha+\rho}}{\sqrt{1+s}}.$$

We first assume Proposition 7.2 and 7.3, and prove Proposition 7.1.

Proof of Proposition 7.1. We have

$$|\Box Z^I \phi| \lesssim \frac{\varepsilon^2}{(1+s)^{2-3\rho}(1+|q|)} \lesssim \frac{\varepsilon^2}{(1+s)^{2-4\rho}(1+|q|)^{1+\rho}},$$

therefore the $L^\infty - L^\infty$ estimate, combined with Proposition 1.4 for the contribution of the initial data yields

$$|Z^I \phi| \leq \frac{C_0 \varepsilon}{\sqrt{1+s}\sqrt{1+|q|}} + \frac{C \varepsilon^2}{\sqrt{1+s}(1+|q|)^{\frac{1}{2}-4\rho}},$$

where C is a constant depending on ρ .

The estimate \tilde{g}_1 follows from Lemma 7.5 with $\alpha = 0$, $\beta = \frac{3}{2} + \delta - \sigma$ combined with Proposition 1.4

$$|Z^I \tilde{g}_1| \leq \frac{C_0 \varepsilon}{\sqrt{1+s}\sqrt{1+|q|}} + \frac{C \varepsilon^2}{(1+s)^{\frac{1}{2}-\rho}},$$

which concludes the proof of Proposition 7.1. \square

Proof of Proposition 7.2. We have, thanks to Proposition 5.2

$$\begin{aligned} |\Box Z^I \phi| &\lesssim \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} |Z^I \tilde{g}_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I \tilde{g}| \\ &+ \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial Z^{I+1} \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| + \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} Z^I \phi| \\ &\lesssim \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I \tilde{g}_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I \tilde{g}| \\ &+ \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^{I+2} \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| + \frac{\varepsilon}{(1+s)^2(1+|q|)^{\frac{1}{2}}} |Z^{I+1} \phi|. \end{aligned}$$

For $I \leq N - 9$ we can estimate $Z^I \tilde{g}_{LL}$ thanks to (4.6),

$$|Z^I \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-3\rho}},$$

we estimate $Z^I \tilde{g}$ thanks to (3.4)

$$|Z^I \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-3\rho}},$$

we estimate $|Z^{I+2} \phi|$ thanks to (3.3)

$$|Z^{I+2} \phi| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-2\rho}},$$

and we estimate $Z^I G^L$ thanks to Proposition (4.56)

$$|Z^I G^L| \lesssim \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}}}.$$

Consequently we obtain

$$\begin{aligned} |\square Z^I \phi| &\lesssim \frac{\varepsilon}{(1+s)^{2-3\rho}(1+|q|)^{\frac{3}{2}-4\rho}} + \frac{\varepsilon}{(1+s)^{2-3\rho}(1+|q|)} \\ &\quad + \frac{\varepsilon}{(1+s)^{\frac{5}{2}}(1+|q|)^{1-4\rho}} + \frac{\varepsilon}{(1+s)^2(1+|q|)^{1-2\rho}}. \end{aligned}$$

□

Proof of Proposition 7.3. We start with the region $q < R$. We estimate first Q_{LL} which contain the limiting contributions. Thanks to Proposition 5.1 we have

$$\begin{aligned} |^I Q_{LL}| &\lesssim \frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^I g_{T\tau}| + \frac{1}{1+|q|} |Z^I g_{LL}| \right) + \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| \\ &\quad + \varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \right) (|\bar{\partial} Z^I \tilde{g}| + |Z^I G^L|) \\ &\lesssim \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-\rho}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| + \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^2} |Z^I g_{LL}| + s.t. \end{aligned}$$

where *s.t.* denotes similar terms. We estimate $\partial Z^I \tilde{g}_1$ in two ways : thanks to (3.4) we have

$$|\partial Z^I \tilde{g}_1| \lesssim \frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-3\rho}},$$

and thanks to (3.45) we have

$$|\partial Z^I \tilde{g}_1| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}-\sigma}(1+s)^{\frac{1}{2}}}.$$

Consequently

$$\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-\rho}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_2| \lesssim \frac{\varepsilon^2}{(1+s)^{2-4\rho}(1+|q|)} + \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho-\sigma}}.$$

We estimate $Z^I g_{LL}$ thanks to (4.6)

$$\frac{\varepsilon^2}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^2} |Z^I g_{LL}| \lesssim \frac{\varepsilon^2}{(1+s)^{2-2\rho}(1+|q|)}.$$

Therefore in the region $q < R$ we have

$$|^I Q_{LL}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho-\sigma}}. \quad (7.1)$$

We now estimate the other contributions in $\square Z^I \tilde{g}$: they are given thanks to Proposition 5.1 by

$$\frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^{I+2} \tilde{g}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^{I+1} \phi| + \frac{1}{1+s} |Z^{I+1} G|.$$

We estimate $Z^{I+2}\tilde{g}$ thanks to (3.4), we estimate $Z^{I+1}\phi$ thanks to (3.3), we estimate $Z^{I+1}G$ thanks to (4.56). We obtain

$$|\square Z^I \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho-\sigma}} + \frac{\varepsilon^2}{(1+s)^2(1+|q|)^{\frac{1}{2}}}.$$

We now look at the region $q > R$. We estimate the new contributions in Q_{LL} which are given by

$$\begin{aligned} & \mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{5}{2}+\delta}}, \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{5}{2}+\delta+\sigma}} \right) \frac{q}{s} |Z^I \partial_\theta^2 b| + \mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^{I+1} \tilde{g}_1| \\ & + \mathbb{1}_{q>R} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right) \\ & \lesssim \mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)(1+|q|)} |Z^{I+1} \tilde{g}_1| \\ & + \mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{5}{2}+\delta}}, \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{5}{2}+\delta+\sigma}} \right) \left(s |\partial_s \partial_\theta b| + \frac{q}{s} |Z^I \partial_\theta^2 b| \right) \end{aligned}$$

We estimate $\partial_s \partial_\theta Z^I b$ thanks to (2.4) (and the Sobolev embedding $H^1(\mathbb{S}^1) \subset L^\infty(\mathbb{S}^1)$)

$$|\partial_s \partial_\theta Z^I b| \lesssim \frac{\varepsilon^2}{(1+s)^{2-\frac{1}{4}}},$$

we estimate $Z^I \partial_\theta^2 b$ thanks to (2.3).

$$|Z^I \partial_\theta^2 b| \lesssim \varepsilon^2,$$

and we estimate $Z^{I+1} \tilde{g}_1$ thanks to (3.53)

$$|Z^{I+1} \tilde{g}_2| \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}+\delta-\sigma} \sqrt{1+s}}.$$

Consequently, we obtain for $q > R$

$$|Q_{LL}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} + \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}(1+s)^{\frac{3}{2}}}. \quad (7.2)$$

The estimate for M^E can be done exactly in the same way, which concludes the proof of Proposition 7.3. □

Proof of Lemma 7.5. Let $t_0 > 0$. We consider times $t \leq t_0$. In the region $r \leq 2t$ we have $|q| \leq t \leq t_0$ and $s \leq 3t \leq 3t_0$. Therefore

$$|\square u| \lesssim \frac{(1+t_0)^{\alpha+\rho}}{(1+|q|)^{1+\frac{\rho}{2}}(1+s)^{\frac{3}{2}+\frac{\rho}{2}}}.$$

In the region $r \leq 2t$, we have $\frac{r}{2} \leq |q| \leq r$ and $r \leq s \leq \frac{3r}{2}$, therefore

$$|\square u| \lesssim \frac{1}{(1+r)^{\frac{3}{2}-\alpha+1+\beta}} \lesssim \frac{(1+t_0)^{\alpha+\rho}}{(1+r)^{\frac{5}{2}-\alpha+\beta}} \lesssim \frac{(1+t_0)^{\alpha+\rho}}{(1+|q|)^{1+\frac{\rho}{2}}(1+s)^{\frac{3}{2}+\frac{\rho}{2}}},$$

provided $\frac{5}{2} + \rho \leq \frac{5}{2} + \beta - \alpha$, i.e. $\beta - \alpha \geq \rho$. Consequently, the $L^\infty - L^\infty$ estimate yields, for $t \leq t_0$

$$|u| \lesssim \frac{(1+t_0)^{\alpha+\rho}}{\sqrt{1+s}}.$$

If we take $t = t_0$ we have proved

$$|u| \lesssim \frac{(1+t)^{\alpha+\rho}}{\sqrt{1+s}},$$

which concludes the proof of Lemma 7.5. \square

Corollary 7.6. *We have the estimate*

$$|Z^{N-9}k| \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-\rho}}.$$

Proof. This is a direct consequence of Lemma 7.5 since the initial data for k are 0 and $\square k$ satisfy the same estimate as $\square \tilde{g}$. \square

7.2 Estimate for $I \leq N - 7$

Proposition 7.7. *We have the estimates for for $I \leq N - 7$*

$$\begin{aligned} |Z^I \tilde{g}| &\leq \frac{C_0 \varepsilon + C \varepsilon^2}{(1+s)^{\frac{1}{2}-3\rho}}, \\ |Z^I \phi| &\leq \frac{C_0 \varepsilon + C \varepsilon^2}{(1+s)^{\frac{1}{2}-2\rho}}. \end{aligned}$$

This proposition is a straightforward consequence of Lemma 7.5, Proposition 1.4 and the following propositions.

Proposition 7.8. *We have the estimate for $I \leq N - 7$*

$$|\square Z^I \phi| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)}, \quad q < R+1,$$

and $\square Z^I \phi = 0$ for $q > R+1$.

Proposition 7.9. *We have the estimate for $I \leq N - 5$ and $q < R$*

$$|\square Z^I \tilde{g}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-2\rho}(1+|q|)},$$

and for $q > R$

$$|\square Z^I \tilde{g}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho-\sigma}}.$$

Proof of Proposition 7.8. We have, thanks to Proposition 5.2

$$\begin{aligned} |\square Z^I \phi| &\lesssim \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} |Z^I \tilde{g}_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I \tilde{g}| \\ &\quad + \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^{I+2} \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| + \frac{\varepsilon}{(1+s)^2(1+|q|)^{\frac{1}{2}}} |Z^{I+1} \phi|. \end{aligned}$$

For $I \leq N - 7$ we can estimate $Z^I \tilde{g}_{LL}$ thanks to (4.5),

$$|Z^I \tilde{g}_{LL}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{3}{2}-\rho}},$$

we estimate $Z^I \tilde{g}$ thanks to (3.50)

$$|Z^I \tilde{g}| \lesssim \frac{\varepsilon(1+|q|)^{\frac{3}{2}}}{(1+s)^{\frac{1}{2}-\rho}},$$

we estimate $|Z^{I+2}\phi|$ thanks to (3.49)

$$|Z^{I+2}\phi| \lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{1}{2}}},$$

and we estimate $Z^I G^L$ thanks to Proposition (4.56)

$$|Z^I G^L| \lesssim \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}}}.$$

Consequently we obtain

$$\begin{aligned} |\square Z^I \phi| &\lesssim \frac{\varepsilon^2}{(1+s)^2(1+|q|)^{1-4\rho}} + \frac{\varepsilon}{(1+s)^{2-\rho}(1+|q|)^{1-4\rho}} + \frac{\varepsilon^2}{(1+s)^{2-\rho}\sqrt{1+|q|}} \\ &\quad + \frac{\varepsilon^2}{(1+s)^{\frac{5}{2}}(1+|q|)^{1-4\rho}} + \frac{\varepsilon^2}{(1+s)^{\frac{5}{2}}} \end{aligned}$$

which concludes the proof of Proposition 7.8. \square

Proof of Proposition 7.9. We start with the region $q < R$. We estimate first Q_{LL} in the same way than in the proof of Proposition 7.3 by

$$\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| + \frac{\varepsilon}{(1+|q|)^2(1+s)^{\frac{1}{2}-\rho}} |Z^I g_{LL}|$$

We estimate $\partial Z^I \tilde{g}_2$ thanks to (3.44)

$$|\partial Z^I \tilde{g}_2| \lesssim \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}-\rho}}.$$

Consequently

$$\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_2| \lesssim \frac{\varepsilon^2}{(1+s)^{2-\rho}(1+|q|)^{\frac{1}{2}}} + \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{\frac{3}{2}-4\rho}}.$$

We estimate $Z^I g_{LL}$ thanks to (4.5),

$$\frac{\varepsilon}{(1+|q|)^2(1+s)^{\frac{1}{2}-\rho}} |Z^I g_{LL}| \lesssim \frac{\varepsilon^2}{(1+|q|)^{\frac{1}{2}}(1+s)^{2-2\rho}}.$$

Consequently

$$|Q_{LL}| \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-2\rho}(1+|q|)}.$$

We now estimate the other contributions in $\square Z^I \tilde{g}$: they are given thanks to Proposition 5.1 by

$$\frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^{I+2}\tilde{g}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^{I+1}\phi| + \frac{1}{1+s} |Z^{I+1}G|.$$

We estimate $|Z^{I+2}\tilde{g}|$ thanks to (3.50), we estimate $Z^{I+1}\phi$ thanks to (3.49) and we estimate $Z^{I+1}G$ thanks to (4.56), since $I+1 \leq N-6$. We obtain

$$|\square Z^I \tilde{g}| \lesssim |Q_{LL}| + \frac{\varepsilon}{(1+s)^{2-2\rho}(1+|q|)^{\frac{1}{2}}} + \frac{\varepsilon}{(1+s)^{\frac{7}{4}}(1+|q|)^{\frac{3}{4}-2\rho}} + \frac{\varepsilon}{(1+s)^2(1+|q|)^{1-4\rho}}.$$

In the exterior region, the same estimates as for $I \leq N-9$ are valid. \square

8 Weighted energy estimate

8.1 On Minkowski space-time

We consider the wave equation on Minkowski space-time $\square u = f$. We introduce the energy-momentum tensor associated to \square

$$Q_{\alpha\beta} = \partial_\alpha u \partial_\beta u - \frac{1}{2} m_{\alpha\beta} m^{\mu\nu} \partial_\mu u \partial_\nu u.$$

We have

$$D^\alpha Q_{\alpha\beta} = f \partial_\beta u.$$

We also note $T = \partial_t$, and introduce the deformation tensor of T

$$\pi_{\alpha\beta} = D_\alpha T_\beta + D_\beta T_\alpha = 0$$

where D is the covariant derivative. We have

$$D^\alpha (Q_{\alpha\beta} T^\beta) = f \partial_t u + Q_{\alpha\beta} \pi^{\alpha\beta} = f \partial_t u. \quad (8.1)$$

We remark that

$$Q_{TT} = \frac{1}{2} ((\partial_t u)^2 + |\nabla u|^2).$$

Proposition 8.1. *Let w be any of our weight functions. We have the following weighted energy estimate for u*

$$\frac{d}{dt} \left(\int Q_{TT} w(q) \right) + C \int w'(q) \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) \lesssim \int w(q) |f \partial_t u|.$$

Proof. We multiply (8.3) by $w(q)$ and integrate it on an hypersurface of constant t . We obtain

$$-\frac{d}{dt} \left(\int Q_{TT} w(q) \right) = \int w(q) f \partial_t u + \int Q_{T\alpha} D^\alpha w. \quad (8.2)$$

We have

$$Q_{T\alpha} D^\alpha w = -2w'(q) m^{\alpha L} Q_{T\alpha} = w'(q) Q_{TL} = w'(q) \left(\partial_t u (\partial_t u + \partial_r u) - \frac{1}{2} (-(\partial_t u)^2 + |\nabla u|^2) \right),$$

so

$$Q_{T\alpha} D^\alpha w = \frac{1}{2} \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) w'(q)$$

which concludes the proof of Proposition 8.1. \square

8.2 On the curved space-time

We consider the equation

$$\square_g u = f,$$

where $g = g_b + \tilde{g}$ is our space-time metric, satisfying the bootstrap assumptions. We now introduce the energy-momentum tensor associated to \square_g

$$Q_{\alpha\beta} = \partial_\alpha u \partial_\beta u - \frac{1}{2} g_{\alpha\beta} g^{\mu\nu} \partial_\mu u \partial_\nu u.$$

We have

$$D^\alpha Q_{\alpha\beta} = f \partial_\beta u.$$

We also note $T = \partial_t$, and introduce the deformation tensor of T

$$\pi_{\alpha\beta} = D_\alpha T_\beta + D_\beta T_\alpha$$

where D is the covariant derivative. We have

$$D^\alpha (Q_{\alpha\beta} T^\beta) = f \partial_t u + Q_{\alpha\beta} \pi^{\alpha\beta}. \quad (8.3)$$

We remark that

$$Q_{TT} = \frac{1}{2} ((\partial_t u)^2 + |\nabla u|^2) + O(\varepsilon (\partial u)^2).$$

Proposition 8.2. *Let w be any of our weight functions. We have the following weighted energy estimate for u*

$$\frac{d}{dt} \left(\int Q_{TT} w(q) \right) + C \int w'(q) \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) \lesssim \frac{\varepsilon}{1+t} \int w(q) (\partial u)^2 + \int w(q) |f \partial_t u|.$$

Proof. We multiply (8.3) by $w(q)$ and integrate it on an hypersurface of constant t . We obtain

$$-\frac{d}{dt} \left(\int Q_{TT} w(q) \right) = \int w(q) (f \partial_t u + Q_{\alpha\beta} \pi^{\alpha\beta}) + \int Q_{T\alpha} D^\alpha w. \quad (8.4)$$

We have

$$Q_{T\alpha} D^\alpha w = -2w'(q) g^{\alpha\bar{L}} Q_{T\alpha} = w'(q) Q_{TL} + w'(q) (g^{\alpha\bar{L}} - m^{\alpha\bar{L}}) Q_{T\alpha}.$$

We calculate

$$\begin{aligned} Q_{TL} &= \partial_t u (\partial_t u + \partial_r u) - \frac{1}{2} (-(\partial_t u)^2 + |\nabla u|^2) + O(g_{LL} (\partial u)^2 + (g - m)_{\mathcal{T}\mathcal{V}} \partial u \bar{\partial} u + (g - m)_{\underline{LL}} (\bar{\partial} u)^2). \\ &= \frac{1}{2} \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) + O(g_{LL} (\partial u)^2 + (g - m)_{\mathcal{T}\mathcal{V}} \partial u \bar{\partial} u + (g - m)_{\underline{LL}} (\bar{\partial} u)^2). \end{aligned}$$

We estimate the metric coefficients in the following way : first we estimate g_b thanks to (2.24)

$$|g_b - m| \lesssim \frac{\varepsilon(1 + |q|)}{1 + s},$$

thanks to (4.7) we estimate

$$|\tilde{g}_{LL}| \leq \frac{(1 + |q|)}{(1 + s)^{\frac{3}{2} - \rho}},$$

thanks to (3.52) we estimate

$$|\tilde{g}_{\mathcal{T}\mathcal{V}}| \lesssim \frac{\varepsilon \sqrt{1 + |q|}}{\sqrt{1 + s}},$$

and thanks to (3.2) we estimate

$$|\tilde{g}_{\underline{LL}}| \lesssim \frac{\varepsilon}{(1 + s)^{\frac{1}{2} - \rho}}.$$

Consequently we have

$$Q_{T\alpha} D^\alpha w = \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) (1 + O(\varepsilon)) w'(q) + w'(q) O\left(\frac{\varepsilon(1 + |q|)}{1 + t} (\partial u)^2 \right),$$

$$Q_{T\alpha}D^\alpha w = \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) (1+O(\varepsilon))w'(q) + O\left(\frac{\varepsilon(1+|q|)}{1+t} (\partial u)^2 \right) w'(q) + O\left(\frac{\varepsilon\sqrt{1+|q|}}{\sqrt{1+t}} \bar{\partial} u \partial u \right) w'(q)$$

and since $|w'(q)| \lesssim \frac{w(q)}{1+|q|}$

$$Q_{T\alpha}D^\alpha w = \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) (1+O(\varepsilon))w'(q) + O\left(\frac{\varepsilon w(q)}{(1+t)} (\partial u)^2 \right). \quad (8.5)$$

We now estimate the deformation tensor of T . We have

$$\pi_{\alpha\beta} = \mathcal{L}_T g_{\alpha\beta} = \partial_t g_{\alpha\beta}.$$

We obtain

$$\begin{aligned} \pi_{LL} &= \partial_T g_{LL} = O\left(\frac{\varepsilon}{1+t} \right), \\ \pi_{UL} &= \partial_T g_{UL} = O\left(\frac{\varepsilon}{1+t} \right), \\ \pi_{L\bar{L}} &= \partial_T g_{L\bar{L}} = O\left(\frac{\varepsilon}{1+t} \right) + O\left(\frac{\varepsilon}{(1+|q|)(1+t)^{\frac{1}{2}-\rho}} \right), \\ \pi_{U\bar{L}} &= \partial_T g_{U\bar{L}} = O\left(\frac{\varepsilon}{1+t} \right) + O\left(\frac{\varepsilon}{(1+|q|)(1+t)^{\frac{1}{2}-\rho}} \right), \\ \pi_{\bar{L}\bar{L}} &= \partial_T g_{\bar{L}\bar{L}} = O\left(\frac{\varepsilon}{1+t} \right) + O\left(\frac{\varepsilon}{(1+|q|)(1+t)^{\frac{1}{2}-\rho}} \right), \\ \pi_{UU} &= \partial_T g_{UU} = O\left(\frac{\varepsilon}{1+t} \right), \end{aligned}$$

Consequently, the terms $Q^{LL}\pi_{LL}$, $Q^{UL}\pi_{UL}$ and $Q^{UU}\pi_{UU}$ give contributions of the form

$$\frac{\varepsilon}{(1+t)} (\partial u)^2. \quad (8.6)$$

We can calculate

$$\begin{aligned} Q_{L\bar{L}} &= \partial_L u \partial_{\bar{L}} u - \frac{1}{2} g_{L\bar{L}} (2g^{L\bar{L}} \partial_L u \partial_{\bar{L}} u + (\partial_U u)^2) + O(g_{L\bar{L}} (\partial u)^2 + (g-m)_{T\bar{V}} \partial u \bar{\partial} u + (g-m)_{\bar{L}\bar{L}} (\bar{\partial} u)^2) \\ &= (\partial_U u)^2 + O\left(\frac{\varepsilon(1+|q|)}{(1+s)} (\partial u)^2 \right) + O(\varepsilon (\bar{\partial} u)^2). \end{aligned}$$

Consequently $Q^{L\bar{L}}\pi_{L\bar{L}}$ gives the contribution

$$\frac{\varepsilon}{(1+t)} (\partial u)^2 + \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-\rho}} (\bar{\partial} u)^2. \quad (8.7)$$

The terms $Q^{LL}\pi_{LL}$ and $Q^{LU}\pi_{LU}$ also give the contribution (8.7).

Thanks to (8.4), (8.5), (8.6) and (8.7) what we obtain is

$$\begin{aligned} & \frac{d}{dt} \left(\int Q_{TT} w(q) \right) + \frac{1}{2} \int w'(q) \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) \\ & \lesssim \frac{\varepsilon}{1+t} \int w(q) (\partial u)^2 + \varepsilon \int \frac{w(q)}{(1+|q|)^{\frac{3}{2}-\rho}} (\bar{\partial} u)^2 + \varepsilon \int w(q) |f \partial_t u|. \end{aligned} \quad (8.8)$$

All our weight functions satisfy

$$\frac{w(q)}{(1+|q|)^{\frac{3}{2}-\rho}} \lesssim w'(q),$$

therefore, for ε small enough, we can subtract from our inequality the term

$$\varepsilon \int \frac{w(q)}{(1+|q|)^{\frac{3}{2}-\rho}} (\bar{\partial}u)^2,$$

and we obtain

$$\frac{d}{dt} \left(\int Q_{TT} w(q) \right) + C \int w'(q) \left((\partial_s u)^2 + \left(\frac{\partial_\theta u}{r} \right)^2 \right) \lesssim \frac{\varepsilon}{1+t} \int w(q) (\partial u)^2 + \int w(q) |f \partial_t u|.$$

This conclude the proof of Proposition 8.2. \square

9 Higher order L^2 estimates

9.1 Estimate of $\partial Z^N \tilde{g}$

Proposition 9.1. *We have*

$$\left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \leq C_0 \varepsilon + C \varepsilon^{\frac{3}{2}} (1+t)^{2\rho}$$

and

$$\int_0^t \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \lesssim C_0^2 \varepsilon^2 + C \varepsilon^3 (1+t)^{4\rho}.$$

Corollary 9.2. *The proof of Proposition 9.1 gives us also*

$$\int_0^t (1+t)^{-2\rho} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \lesssim C_0^2 \varepsilon^2 + C \varepsilon^3 (1+t)^{2\rho}.$$

Corollary 9.3. *We have*

$$\left\| w_1^{\frac{1}{2}} \partial Z^N k \right\|_{L^2} \leq C \varepsilon^{\frac{3}{2}} (1+t)^{2\rho}$$

and

$$\int_0^t \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N k \right\|_{L^2}^2 \lesssim C \varepsilon^3 (1+t)^{4\rho}.$$

$$\int_0^t (1+t)^{-2\rho} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N k \right\|_{L^2}^2 \lesssim C \varepsilon^3 (1+t)^{2\rho}.$$

Proof of Proposition 9.1. We use the weighted energy estimate in the curved metric. Thanks to Proposition 8.2 we have

$$\frac{d}{dt} \left(\int (\partial Z^N \tilde{g})^2 w_1(q) \right) + C \int w_1'(q) (\bar{\partial} Z^N \tilde{g})^2 \lesssim \frac{\varepsilon}{1+t} \int w_1(q) (\partial Z^N \tilde{g})^2 + \left| \int w_1(q) \partial_t Z^N \tilde{g} \square_g Z^N \tilde{g} \right|.$$

And consequently

$$\begin{aligned} & \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g}(t) \right\|_{L^2}^2 + \int_0^t \left\| w_1'(q)^{\frac{1}{2}} \right\|_{L^2}^2 \\ & \lesssim \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g}(0) \right\|_{L^2}^2 + \int_0^t \frac{\varepsilon}{1+t} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g}(t) \right\|_{L^2}^2 + \int_0^t \left| \int w_1 \partial_t Z^N \tilde{g} \square_g Z^N \tilde{g} dx \right| dt. \end{aligned} \tag{9.1}$$

First, thanks to (3.19) we have

$$\int_0^t \frac{\varepsilon}{1+t} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g}(t) \right\|_{L^2}^2 \lesssim \int_0^t \frac{\varepsilon^3}{(1+t)^{1-4\rho}} \lesssim \varepsilon^3 (1+t)^{4\rho}. \quad (9.2)$$

We will decompose $\square_g Z^N \tilde{g} = A^N + B^N + C^N$ where

$$\left\| w_1^{\frac{1}{2}} A^N \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-2\rho}},$$

$$\int_0^t \varepsilon^{-1} (1+\tau) \left\| w_1^{\frac{1}{2}} B^N \right\|_{L^2}^2 d\tau \lesssim \varepsilon^3 (1+t)^{4\rho},$$

and C^N is dealt with in a specific manner (like integration by part). A term A^N will give the contribution

$$\int_0^t \left| \int w_1 \partial_t Z^N \tilde{g} A^N dx \right| \lesssim \int_0^t \|w_1^{\frac{1}{2}} A^N\|_{L^2} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \lesssim \int_0^t \frac{\varepsilon^3}{(1+\tau)^{1-4\rho}} \lesssim \varepsilon^3 (1+t)^{4\rho}, \quad (9.3)$$

and a term B^N will give the contribution

$$\begin{aligned} \int_0^t \left| \int w_1 \partial_t Z^N \tilde{g} B^N dx \right| &\lesssim \int_0^t \varepsilon^{-1} (1+\tau) \|w_1^{\frac{1}{2}} B^N\|_{L^2}^2 d\tau + \int_0^t \frac{\varepsilon}{1+\tau} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2}^2 \\ &\lesssim \varepsilon^3 (1+t)^{4\rho} + \int_0^t \frac{\varepsilon^3}{(1+\tau)^{1-4\rho}} \lesssim \varepsilon^3 (1+t)^{4\rho}. \end{aligned} \quad (9.4)$$

We estimate $\square_g Z^N \tilde{g}$ thanks to Proposition 5.1.

$$|\square_g Z^N \tilde{g}| \lesssim |^I Q| + |^I M| + |^I M^E|.$$

We start with Q_{LL}

$$\begin{aligned} |Q_{LL}| &\lesssim \frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^I \tilde{g}_1| + \frac{1}{1+|q|} |Z^I g_{LL}| \right) + \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| \\ &+ \varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \right) (|\bar{\partial} Z^I \tilde{g}| + |Z^I G^L|) \\ &+ \mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{5}{2}+\delta}}, \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{5}{2}+\delta+\sigma}} \right) \frac{q}{s} |Z^I \partial_\theta^2 b| + \mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}_1| \\ &+ \mathbb{1}_{q>R} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right). \end{aligned}$$

We estimate the contributions term by term

$$\begin{aligned} &\int_0^t \varepsilon^{-1} (1+\tau) \left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 \\ &\lesssim \varepsilon (1+t)^{2\rho} \int_0^t \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 \\ &\lesssim \varepsilon^3 (1+t)^{4\rho}, \end{aligned} \quad (9.5)$$

where we have used $\frac{w_1}{(1+|q|)^2} \lesssim w'_2(q)$ and the bootstrap assumption (3.23). We estimate

$$\begin{aligned} & \int_0^t \varepsilon^{-1}(1+\tau) \left\| \frac{w_1^{\frac{1}{2}}}{(1+|q|)^2(1+s)^{\frac{1}{2}-\rho}} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 \\ & \lesssim \varepsilon(1+t)^{2\rho} \int_0^t \left\| \frac{w_1^{\frac{1}{2}}}{(1+|q|)^2} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 \\ & \lesssim \varepsilon^3(1+t)^{4\rho} \end{aligned} \quad (9.6)$$

thanks to (4.14). We estimate

$$\left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}}} \partial Z^N \tilde{g}_1 \right\|_{L^2} \lesssim \frac{\varepsilon}{1+t} \|w_1^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-2\rho}}. \quad (9.7)$$

We have

$$\left\| \varepsilon \frac{w_1^{\frac{1}{2}}}{\sqrt{1+s}\sqrt{1+|q|}} Z^N G^L \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)} \left(\int \frac{1}{(1+|q|)^{1+2\sigma}} \|r Z^N G^L\|_{L^2(\mathbb{S}^1)} dr \right)^{\frac{1}{2}} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}, \quad (9.8)$$

$$\begin{aligned} & \int_0^t \varepsilon^{-1}(1+t) \left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{\sqrt{1+s}\sqrt{1+|q|}} \bar{\partial} Z^I \tilde{g} \right\|_{L^2} \\ & \lesssim \varepsilon \int_0^t \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \\ & \lesssim \varepsilon^3(1+t)^{4\rho}, \end{aligned} \quad (9.9)$$

$$\left\| \varepsilon \frac{w_1^{\frac{1}{2}}}{\sqrt{1+s}\sqrt{1+|q|}} Z^N G^L \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)} \left(\int \frac{1}{(1+|q|)^{1+2\sigma}} \|r Z^N G^L\|_{L^2(\mathbb{S}^1)} dr \right)^{\frac{1}{2}} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}, \quad (9.10)$$

thanks to (4.38). We estimate

$$\begin{aligned} & \left\| w_1^{\frac{1}{2}} \mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{\frac{3}{2}+\delta}} \partial_\theta^2 Z^N b \right\|_{L^2} \\ & \lesssim \varepsilon \left(\int \frac{1}{(1+|q|)^{1+2\sigma}(1+s)^{3-2\rho}} \|\partial_\theta^2 Z^N b\|_{L^2(\mathbb{S}^1)}^2 r dr \right)^{\frac{1}{2}} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}, \end{aligned} \quad (9.11)$$

where we have used (2.5). We can bound M^E

$$\begin{aligned} |M^E| & \lesssim \frac{1}{1+s} \left(|\partial Z^N \tilde{g}| + \frac{1}{1+|q|} |Z^N \tilde{g}| \right) \\ & + \frac{\varepsilon}{(1+s)(1+|q|)^{2+\delta-\rho}} \left(s |\partial_s Z^I b| + q |\partial_s \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_\theta^2 b| \right) \\ & + \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right). \end{aligned}$$

Consequently the estimate for M^E will also give the remaining of the estimate of Q_{LL} . We estimate

$$\left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{1+s} \left(|\partial Z^N \tilde{g}| + \frac{1}{1+|q|} |Z^N \tilde{g}| \right) \right\|_{L^2} \lesssim \frac{\varepsilon}{1+t} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \lesssim \varepsilon^2 \frac{1}{(1+t)^{1-2\rho}}. \quad (9.12)$$

$$\left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\rho}} \partial_s \partial_\theta Z^I b \right\|_{L^2} \lesssim \varepsilon \left(\int \frac{1}{(1+|q|)^{1+2\sigma-2\rho}} \|\partial_s Z^I b\|_{H^1(\mathbb{S}^1)}^2 r dr \right)^{\frac{1}{2}}.$$

and so

$$\begin{aligned} & \int_0^t \varepsilon^{-1} (1+t) \left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\rho}} \partial_s \partial_\theta Z^I b \right\|_{L^2}^2 \\ & \lesssim \int_0^t \int_{t+R}^\infty \frac{(1+t)r}{(1+|q|)^{1+2\sigma-2\rho}} \|\partial_s Z^I b\|_{H^1}^2 dr dr \\ & \lesssim \int_R^\infty \frac{1}{(1+|q|)^{1+2\sigma-2\rho}} \left(\int_0^{2t+q} (1+s)^2 \|\partial_s Z^I b\|_{H^1}^2 ds \right) dq \\ & \lesssim (1+t)^{2\rho}, \end{aligned} \tag{9.13}$$

where we have used (2.16) and (2.13). The term involving $\partial_\theta^2 Z^N b$ as already been estimated. We now estimate

$$\left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta} (1+s)^{\frac{1}{2}-\rho}} s |\partial_s^2 \partial_\theta Z^I b| \right\|_{L^2} \lesssim \varepsilon \left(\int \frac{1}{(1+|q|)^{1+2\sigma}} s^{1+2\rho} \|\partial_s^2 Z^I b\|_{H^1(\mathbb{S}^1)}^2 r dr \right)^{\frac{1}{2}},$$

and so

$$\int_0^t \varepsilon^{-1} (1+t) \left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta} (1+s)^{\frac{1}{2}-\rho}} s |\partial_s^2 \partial_\theta Z^I b| \right\|_{L^2}^2 \lesssim \varepsilon \int_0^t (1+s)^{3+2\rho} \|\partial_s^2 Z^I b\|_{H^1(\mathbb{S}^1)}^2 ds \lesssim \varepsilon^2 (1+t)^{4\rho}, \tag{9.14}$$

where we have used (3.39) and (2.14).

$$\left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta} (1+s)^{\frac{1}{2}-\rho}} \partial_s \partial_\theta^2 Z^I b \right\|_{L^2} \lesssim \varepsilon \left(\int \frac{1}{(1+|q|)^{1+2\sigma}} (1+s)^{2\rho} \|\partial_s Z^I b\|_{H^2(\mathbb{S}^1)}^2 r dr \right)^{\frac{1}{2}},$$

and so

$$\int_0^t \varepsilon^{-1} (1+t) \left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta} (1+s)^{\frac{1}{2}-\rho}} |\partial_s \partial_\theta^2 Z^I b| \right\|_{L^2}^2 \lesssim \varepsilon \int_0^t (1+s)^{1+2\rho} \|\partial_s \partial_\theta^2 Z^I b\|_{H^1(\mathbb{S}^1)}^2 ds \lesssim \varepsilon^2 (1+t)^{4\rho}, \tag{9.15}$$

where we have used (2.6). We now turn to the term involving $\partial_\theta^3 Z^N b$. Unfortunately, we don't have a good estimate for $\partial_\theta^3 Z^N b$. To treat terms of the form

$$\partial \tilde{g}_1 \frac{q}{r^2} \chi(q) \partial_\theta^3 Z^N b,$$

we remark that

$$\begin{aligned} & \left| \partial \tilde{g}_1 \frac{q}{r^2} \chi(q) \partial_\theta^3 Z^N b - \square_g (g_{00} q \partial \tilde{g}_1 \chi(q) \partial_\theta Z^N b) \right| \\ & \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho} (1+|q|)^{\frac{3}{2}+\delta}} |\partial_\theta^2 Z^N b| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho} (1+|q|)^{\frac{1}{2}+\delta}} |\partial_s \partial_\theta^2 Z^N b| + \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho} (1+|q|)^{\frac{1}{2}+\delta}} |\partial_s^2 \partial_\theta Z^N b|. \end{aligned}$$

and all these terms have already been estimated. We easily check that $q \partial \tilde{g}_1 \chi(q) \partial_\theta Z^N b$ satisfy the same estimates as the one we want \tilde{g} to satisfy.

The terms $Q_{U\underline{L}}$ and $Q_{L\underline{L}}$ can be estimated in the same manner than $Q_{\underline{L}\underline{L}}$.

${}^I M$ can be estimated by

$$\frac{\varepsilon}{1+s} |\partial Z^N \tilde{g}| + \frac{\varepsilon}{\sqrt{1+|q|}\sqrt{1+s}} |\bar{\partial} Z^N \tilde{g}| + \frac{\varepsilon}{(1+s)(1+|q|)} |Z^N \tilde{g}| + \frac{1}{1+s} |Z^N G| + |\bar{\partial} Z^N G|.$$

All these terms have already been estimated, except the last two. They can be estimated by

$$\begin{aligned} & \chi'(q) (|\partial_s \partial_\theta Z^N b| + s |\partial_s^2 Z^N b|) + \frac{1}{1+s} |Z^N G^L| \\ & + \frac{1}{1+s} \Upsilon\left(\frac{r}{t}\right) \left| Z^N \bar{\partial} \int_\infty^r (\partial_q \phi) r dr \right| + \frac{1}{(1+r)^2} (1 - \chi(q)) \Upsilon\left(\frac{r}{t}\right) |\partial_\theta Z^N h|. \end{aligned}$$

We estimate $\frac{1}{1+s} \Upsilon\left(\frac{r}{t}\right) |Z^N \bar{\partial} \int_\infty^r (\partial_q \phi) r dr|$. We have

$$\begin{aligned} \left\| \bar{\partial} Z^N \int (\partial_q \phi) r dr \right\|_{L^2(\mathbb{S}^1)} & \lesssim \int \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} \|\bar{\partial} Z^N \phi\|_{L^2(\mathbb{S}^1)} r dr \\ & \lesssim \varepsilon \left\| w'(q)^{\frac{1}{2}} \bar{\partial} \partial Z^N \phi \right\|_{L^2}, \end{aligned}$$

so

$$\int \varepsilon^{-1} (1+t) \left\| w_1^{\frac{1}{2}} \frac{1}{1+s} \Upsilon\left(\frac{r}{t}\right) \bar{\partial} \int (\partial_q \phi) r dr \right\|_{L^2}^2 \lesssim \int \varepsilon \left\| w'(q)^{\frac{1}{2}} \bar{\partial} \partial Z^N \phi \right\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho}. \quad (9.16)$$

The contributions (9.7), (9.8) and (9.10), (9.11) correspond to A^N , and the contributions (9.5), (9.6), (9.12), (9.9), (9.13), (9.14), (9.15) and (9.16) correspond to B^N .

The terms we will now estimate correspond to C^N . To estimate the contribution $\frac{1}{(1+r)^2} (1 - \chi(q)) \Upsilon\left(\frac{r}{t}\right) \partial_\theta Z^N h$ we do the following

$$\begin{aligned} & \int_0^t \int w_1 \frac{1}{(1+r)^2} \Upsilon\left(\frac{r}{t}\right) (1 - \chi(q)) \partial_\theta Z^N h \partial_t Z^N \tilde{g} \\ & = \int_0^t \int w_1 \frac{1}{(1+r)} \Upsilon\left(\frac{r}{t}\right) (1 - \chi(q)) Z^N h \partial_t \bar{\partial} Z^N \tilde{g} \\ & = \left[\int w_1 \frac{1}{(1+r)} \Upsilon\left(\frac{r}{t}\right) (1 - \chi(q)) Z^N h \bar{\partial} Z^N \tilde{g} \right]_0^t - \int_0^t \int w_1 \Upsilon\left(\frac{r}{t}\right) \frac{1}{(1+r)} (1 - \chi(q)) \partial_s Z^N h \bar{\partial} Z^N \tilde{g} \\ & \quad - \int_0^t \int \partial_q (w_1 (1 - \chi(q)) \Upsilon\left(\frac{r}{t}\right)) \frac{1}{(1+r)} Z^N h \bar{\partial} Z^N \tilde{g} \end{aligned}$$

We estimate

$$\begin{aligned} & \left| \left[\int w_1 \frac{1}{(1+r)} \Upsilon\left(\frac{r}{t}\right) (1 - \chi(q)) Z^N h \bar{\partial} Z^N \tilde{g} \right]_0^t \right| \\ & \lesssim \left\| w_1^{\frac{1}{2}} \frac{1}{1+r} \Upsilon\left(\frac{r}{t}\right) (1 - \chi(q)) Z^N h \right\|_{L^2} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \lesssim \varepsilon (1+t)^{3\rho}, \end{aligned} \quad (9.17)$$

$$\begin{aligned} & \left| \int_0^t \int w_1 \frac{1}{(1+r)} \Upsilon\left(\frac{r}{t}\right) (1 - \chi(q)) \partial_s Z^N h \bar{\partial} Z^N \tilde{g} \right| \\ & \lesssim \int_0^t \left\| w_1^{\frac{1}{2}} \frac{1}{(1+r)} (1 - \chi(q)) \Upsilon\left(\frac{r}{t}\right) \partial_s Z^N h \right\|_{L^2} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \\ & \lesssim \int_0^t \varepsilon^{-1} (1+t) \int w_1 \frac{(1 - \chi(q))^2}{r^2} \Upsilon\left(\frac{r}{t}\right) \|\partial_s Z^N h\|_{L^2(\mathbb{S}^1)}^2 r dr + \int_0^t \frac{\varepsilon}{(1+t)} \left\| w_1^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2}^2 \\ & \lesssim \varepsilon^3 (1+t)^{4\rho} + \int_0^t (1+s) \|\partial_s Z^N h\|_{L^2(\mathbb{S}^1)}^2 \end{aligned}$$

and consequently

$$\left| \int_0^t \int w_1 \frac{1}{(1+r)} \Upsilon\left(\frac{r}{t}\right) (1-\chi(q)) \partial_s Z^N h \bar{\partial} Z^N \tilde{g} \right| \lesssim \varepsilon^3 (1+t)^{4\rho} \quad (9.18)$$

$$\begin{aligned} & \left| \int_0^t \int \partial_q \left(w_1 (1-\chi(q)) \Upsilon\left(\frac{r}{t}\right) \right) \frac{1}{(1+r)} Z^N h \bar{\partial} Z^N \tilde{g} \right| \\ & \lesssim \int_0^t \left\| w_1^{\frac{1}{2}} (1+|q|)^{-\frac{1}{2}} \Upsilon\left(\frac{r}{t}\right) \frac{1}{(1+r)} (1-\chi(q)) Z^N h \right\|_{L^2} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2} \\ & \lesssim \int_0^t \varepsilon^{-1} \int w_1 \frac{(1-\chi(q))^2}{r^2(1+|q|)} \Upsilon\left(\frac{r}{t}\right) \|Z^N h\|_{L^2(\mathbb{S}^1)}^2 r dr + \int_0^t \varepsilon \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \\ & \lesssim \varepsilon^3 (1+t)^{4\rho} + \int_0^t \frac{1}{1+t} \|Z^N h\|_{L^2(\mathbb{S}^1)}^2 \end{aligned}$$

and consequently

$$\left| \int_0^t \int \partial_q \left(w_1 (1-\chi(q)) \Upsilon\left(\frac{r}{t}\right) \right) \frac{1}{(1+r)} Z^N h \bar{\partial} Z^N \tilde{g} \right| \lesssim \varepsilon^3 (1+t)^{4\rho}. \quad (9.19)$$

The term $\chi'(q) s \partial_s^2 Z^N b$, which is also present in $R_{\mu\nu}^1$, can be estimated in the following way : we estimate first the term

$$\chi'(q) s \partial_s Z^N f_2,$$

where we use the decomposition of $\partial_s Z^N b$ (2.9). We calculate

$$\begin{aligned} & \int w_1(q) \chi'(q) s \partial_s Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta \\ & = \partial_t \int w_1(q) \chi'(q) s Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta - \int \partial_t (w_1(q) \chi'(q) s r) Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta \\ & \quad - \int w_1(q) \chi'(q) s Z^N f_2 \partial_t^2 Z^N \tilde{g} r dr d\theta \\ & \quad - \int \partial_r (w_1(q) \chi'(q) s r) Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta - \int w_1(q) \chi'(q) s Z^N f_2 \partial_t \partial_r Z^N \tilde{g} r dr d\theta \\ & = \partial_t \int w_1(q) \chi'(q) s Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta - \int \partial_s (w_1(q) \chi'(q) s) Z^N f_2 \partial_t Z^N \tilde{g} r dd\theta \\ & \quad - \partial_t \int w_1(q) \chi'(q) s Z^N f_2 \partial_s Z^N \tilde{g} r dr d\theta - \int \partial_t (w_1(q) \chi'(q) s Z^N f_2) \partial_s Z^N \tilde{g} r dr d\theta \\ & = \partial_t A - \int \partial_s (w_1(q) \chi'(q) s) Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta - \int \partial_t (w_1(q) \chi'(q) s Z^N f_2) \partial_s Z^N \tilde{g} r dr d\theta \end{aligned}$$

where we have noted

$$A = \int w_1(q) \chi'(q) s Z^N f_2 \partial_t Z^N \tilde{g} r dr d\theta - \int w_1(q) \chi'(q) s Z^N f_2 \partial_s Z^N \tilde{g} r dr d\theta.$$

We estimate, noticing that in the region $\chi'(q) \neq 0$ we have $t \sim s \sim r$

$$\begin{aligned} \int_0^t \left| \int w_1(q) \chi'(q) Z^N f_2 \partial_t Z^N \tilde{g} r dd\theta \right| & \lesssim \int_0^t \left(\int \chi'(q)^2 (Z^N f_2)^2 r dr d\theta \right)^{\frac{1}{2}} \left(\int \alpha_1(q) w(q)^2 \partial_t Z^N \tilde{g} r dd\theta \right)^{\frac{1}{2}} \\ & \lesssim \int_0^t \frac{\sqrt{\varepsilon}}{1+t} \|w_1^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2}^2 + \int_0^t \int \frac{1}{\sqrt{\varepsilon}} (1+t)^2 \chi'(q)^2 \|Z^N f_2\|_{L^2(\mathbb{S}^1)}^2 dr d\tau \end{aligned}$$

and so

$$\int_0^t \left| \int w_1(q) \chi'(q) Z^N f_2 \partial_t Z^N \tilde{g} r d d \theta \right| \lesssim \varepsilon^3 (1+t)^{4\rho} + \int_0^t (1+s)^2 \|Z^N f_2\|_{L^2(\mathbb{S}^1)}^2 \lesssim \varepsilon^3 (1+t)^{4\rho}, \quad (9.20)$$

where we have used (2.13).

$$\begin{aligned} & \int_0^t \left| \int \partial_t(w_1(q) \chi'(q) s) Z^N f_2 \partial_s Z^N \tilde{g} r d r d \theta \right| \\ & \lesssim \int_0^t \left(\int \chi'(q)^2 (Z^N f_2)^2 r d r d \theta \right)^{\frac{1}{2}} \left(\int \alpha_1(q) w'(q)^2 \partial_s Z^N \tilde{g} r d d \theta \right)^{\frac{1}{2}} + s.t. \\ & \lesssim \sqrt{\varepsilon} \int_0^t \|w'_1(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}\|_{L^2}^2 + \int_0^t \int \frac{1}{\sqrt{\varepsilon}} (1+t)^3 \chi'(q)^2 \|Z^N f_2\|_{L^2(\mathbb{S}^1)}^2 d r d \tau \end{aligned}$$

and so

$$\int_0^t \left| \int \partial_t(w_1(q) \chi'(q) s) Z^N f_2 \partial_s Z^N \tilde{g} r d r d \theta \right| \lesssim \varepsilon^3 (1+t)^{4\rho}, \quad (9.21)$$

where we have used (2.13).

$$\begin{aligned} & \int_0^t \left| \int w_1(q) \chi'(q) s \partial_s Z^N f_2 \partial_s Z^N \tilde{g} r d r d \theta \right| \\ & \lesssim \int_0^t \left(\int \chi'(q)^2 (\partial_s Z^N f_2)^2 r d r d \theta \right)^{\frac{1}{2}} \left(\int \alpha_1(q) w'(q)^2 \partial_s Z^N \tilde{g} r d d \theta \right)^{\frac{1}{2}} \\ & \lesssim \sqrt{\varepsilon} \int_0^t \|w'_1(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}\|_{L^2}^2 + \int_0^t \int \frac{1}{\sqrt{\varepsilon}} (1+t)^3 \chi'(q)^2 \|\partial_s Z^N f_2\|_{L^2(\mathbb{S}^1)}^2 d r d \tau \end{aligned}$$

and so

$$\int_0^t \left| \int w_1(q) \chi'(q) s \partial_s Z^N f_2 \partial_s Z^N \tilde{g} r d r d \theta \right| \lesssim \varepsilon^3 (1+t)^{4\rho}, \quad (9.22)$$

where we have used (2.14). We now turn to the estimate of A

$$\begin{aligned} |A| & \lesssim \left| \int w_1(q) \chi'(q) s Z^N f_2 \partial Z^N \tilde{g} r d r d \theta \right| \\ & \lesssim (1+t)^{\frac{3}{2}} \|Z^N f_2\|_{L^2(\mathbb{S}^1)} \|w_1^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2} \lesssim \varepsilon^3 (1+t)^{3\rho}, \end{aligned} \quad (9.23)$$

where we have used (2.11). We now estimate the contribution of

$$\chi'(q) s \partial_s Z^N f_1.$$

We have

$$\begin{aligned} & \int_0^t \left| \int w_1(q) \chi'(q) s \partial_s Z^N f_1 \partial_t Z^N \tilde{g} r d r d \theta \right| \\ & \lesssim \int_0^t \int \frac{1}{\sqrt{\varepsilon}} (1+s)^4 \chi'(q)^2 \|\partial_s Z^N f_1\|_{L^2(\mathbb{S}^1)}^2 d r d \tau + \int_0^t \frac{\sqrt{\varepsilon}}{(1+\tau)} \|w_1^{\frac{1}{2}} \partial_t Z^N \tilde{g}\|_{L^2}^2 d \tau \end{aligned}$$

and consequently

$$\int_0^t \left| \int w_1(q) \chi'(q) s \partial_s Z^N f_1 \partial_t Z^N \tilde{g} r d r d \theta \right| \lesssim \varepsilon^3 (1+t)^{4\rho} + \varepsilon^{-1} \int_0^t (1+s)^4 \|\partial_s Z^N f_1\|_{L^2(\mathbb{S}^1)}^2 \lesssim \varepsilon^3 (1+t)^{4\rho}, \quad (9.24)$$

where we have used (2.12). Estimates (9.3), (9.4), (9.17), (9.18), (9.19), (9.20), (9.21), (9.22), (9.23) and (9.24) conclude the proof of Proposition 9.1. \square

Proof of Corollary 9.2. We use the energy estimate

$$\frac{d}{dt} \left(\int (\partial Z^N \tilde{g})^2 w_1(q) \right) + C \int w'(q) (\bar{\partial} Z^N \tilde{g})^2 \lesssim \frac{\varepsilon}{1+t} \int w_1(q) (\partial Z^N \tilde{g})^2 + \left| \int w_1(q) \partial_t Z^N \tilde{g} \square_g Z^N \tilde{g} \right|,$$

we multiply it by $(1+t)^{-2\rho}$, and notice that

$$\frac{d}{dt} \left((1+t)^{-2\rho} \int (\partial Z^N \tilde{g})^2 w_1(q) \right) \lesssim (1+t)^{-2\rho} \frac{d}{dt} \left(\int (\partial Z^N \tilde{g})^2 w_1(q) \right).$$

Then Corollary 9.2 can be proved with exactly the same step as Proposition 9.1. \square

Proof of Corollary 9.3. We perform the energy estimate for k

$$\frac{d}{dt} \left(\int (\partial Z^N k)^2 w_1(q) \right) + C \int w'(q) (\bar{\partial} Z^N k)^2 \lesssim \frac{\varepsilon}{1+t} \int w_1(q) (\partial Z^N k)^2 + \left| \int w_1(q) \partial_t Z^N \tilde{g} \square_g Z^N k \right|,$$

then the fact that the initial data for k are 0, and that $\square_g k$ satisfy the same estimates as $\square_g \tilde{g}$ yield Corollary 9.3. \square

9.2 Estimate of $\partial Z^N \tilde{g}_1$

We need the following corollary of Proposition 5.1.

Corollary 9.4. *We have*

$$\square_g Z^N \tilde{g}_1 = Z^N R^1 + {}^N M + {}^N M^E + Q_{\mathcal{T}\mathcal{V}} + O \left(\Upsilon \frac{1}{r^2} \partial_\theta k \right),$$

Proof. We expressed the 2-forms dq^2 in the coordinate (t, x_1, x_2)

$$dq^2 = (dr - dt)^2 = (\cos(\theta) dx^1 + \sin(\theta) dx^2 - dt)^2$$

Therefore, we will have, in the coordinates x_1, x_2

$$\square \left(\Upsilon \left(\frac{r}{t} \right) g_{\underline{L}\underline{L}} dq^2 \right)_{\mu\nu} - \square \left(\Upsilon \left(\frac{r}{t} \right) g_{\underline{L}\underline{L}} \right) (dq^2)_{\mu\nu} = \Upsilon \left(\frac{r}{t} \right) \frac{1}{r^2} (u_{\mu\nu}^1(\theta) g_{\underline{L}\underline{L}} + u_{\mu\nu}^2(\theta) \partial_\theta g_{\underline{L}\underline{L}}) \quad (9.25)$$

where $u_{\mu\nu}^1$ and $u_{\mu\nu}^2$ are some trigonometric functions. \square

Proposition 9.5. *We have*

$$\begin{aligned} \left\| w_2^{\frac{1}{2}} \partial Z^N \tilde{g}_1 \right\|_{L^2} &\leq C_0 \varepsilon + C \varepsilon^{\frac{5}{4}} (1+t)^\rho, \\ \int_0^t \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2} &\lesssim C_0 \varepsilon^2 + C \varepsilon^{\frac{5}{2}} (1+t)^{2\rho}. \end{aligned}$$

Proof. We use the weighted energy estimate in the background metric g

$$\begin{aligned} &\| w_2^{\frac{1}{2}} \partial Z^N \tilde{g}_1(t) \|_{L^2}^2 + \int_0^t \| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_1 \|_{L^2}^2 \\ &\lesssim \| w_2^{\frac{1}{2}} \partial Z^N \tilde{g}_1(0) \|_{L^2}^2 + \int_0^t \frac{\varepsilon}{1+t} \| w_2^{\frac{1}{2}} \partial Z^N \tilde{g}_1(t) \|_{L^2}^2 + \left| \int_0^t \int w_2 \partial_t Z^N \tilde{g}_1 \square_g Z^N \tilde{g}_1 dx dt \right|. \end{aligned}$$

We decompose $\square_g Z^N \tilde{g}_{\mathcal{T}\mathcal{T}} = A^N + B^N + C^N$ with

$$\left\| w_2^{\frac{1}{2}} A^N \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}$$

$$\int_0^t \varepsilon^{-1}(1+s) \left\| w_2^{\frac{1}{2}} B^N \right\|_{L^2}^2 ds \lesssim \varepsilon^{\frac{5}{2}}(1+t)^{2\rho}$$

and C^N is dealt with in a specific manner. We start with ${}^N M$

$$\begin{aligned} |{}^N M| &\lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |\partial Z^N \phi| + \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^N \tilde{g}| + \frac{1}{1+s} |Z^N \tilde{g}| \right) \\ &+ \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial Z^N \tilde{g}| + \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} |Z^N \tilde{g}_{\mathcal{T}\mathcal{T}}| + \frac{1}{1+s} |Z^N G| + |\bar{\partial} Z^N G| \\ &+ \varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \right) \left(|\bar{\partial} Z^N \tilde{g}_1| + \frac{1}{1+|q|} |Z^N g_{LL}| \right). \end{aligned}$$

We estimate

$$\left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2},$$

where we used $\frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}-\rho}} \leq w_1'(q)^{\frac{1}{2}}$ and so

$$\int_0^t \varepsilon^{-1}(1+\tau) \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{1}{2}-\rho}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 d\tau \lesssim \int_0^t \varepsilon(1+t)^{-2\rho} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \lesssim \varepsilon^3(1+t)^{2\rho}.$$

We estimate

$$\left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)^2(1+|q|)^{\frac{1}{2}-\rho}} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{1+2\rho}} \left\| \frac{w_1(q)^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^3}{1+t},$$

where we have used (3.25),

$$\begin{aligned} \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} \partial Z^N \tilde{g} \right\|_{L^2} &\lesssim \frac{\varepsilon}{(1+t)^{1+2\rho}} \left\| w_1(q)^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^3}{1+t}, \\ \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} Z^N \tilde{g}_{\mathcal{T}\mathcal{T}} \right\|_{L^2} &\lesssim \frac{1}{1+t} \left\| \frac{w_2^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g}_1 \right\|_{L^2} \lesssim \frac{\varepsilon^3}{(1+t)^{1-\rho}}, \end{aligned}$$

where we have used (3.57).

$$\left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \bar{\partial} Z^N \tilde{g}_{\mathcal{T}\mathcal{T}} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}}} \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_{\mathcal{T}\mathcal{T}} \right\|_{L^2},$$

so

$$\int_0^t \varepsilon^{-1}(1+t) \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 \lesssim \int_0^t \varepsilon \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 \lesssim \varepsilon^3(1+t)^{2\rho},$$

where we have used (3.23).

$$\int_0^t \varepsilon^{-1}(1+t) \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}}(1+s)^{\frac{1}{2}}} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 \lesssim \int_0^t \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 \lesssim \varepsilon(1+t)^{2\rho},$$

where we have used (4.16). We estimate the term involving G in the same way than in the previous section : see (9.8) and (9.17) to (9.24). We now estimate the contribution of terms coming from the non commutation of the wave operator with the null frame. It is sufficient to estimate

$$\left\| w_2^{\frac{1}{2}} \Upsilon \left(\frac{r}{t} \right) \frac{1}{r} \bar{\partial} k \right\|_{L^2} \lesssim \frac{1}{(1+t)^{\frac{1}{2}+\sigma}} \left\| \frac{w_1^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}}} \bar{\partial} k_{1,2} \right\|_{L^2},$$

which yields

$$\int_0^t \varepsilon^{-\frac{1}{2}}(1+t) \left\| w_2^{\frac{1}{2}} \Upsilon \left(\frac{r}{t} \right) \frac{1}{r} \bar{\partial} k \right\|_{L^2}^2 \lesssim \varepsilon \int_0^t (1+t)^{-2\rho} \left\| \frac{w_1^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}}} \bar{\partial} k_{1,2} \right\|_{L^2}^2 \lesssim \varepsilon^{\frac{5}{2}}(1+t)^{2\rho}.$$

We now estimate the contribution of M^E :

$$\begin{aligned} |M^E| &\lesssim \frac{\varepsilon}{(1+s)} \left(|\bar{\partial} Z^N \tilde{g}| + \frac{|q|}{1+s} |\partial Z^N \tilde{g}| + \frac{1}{1+s} |Z^N \tilde{g}| + \frac{1}{1+|q|} |\tilde{g} \tau \tau| \right) \\ &\quad + \frac{\varepsilon}{(1+s)(1+|q|)^{2+\delta-\rho}} \left(s |\partial_s Z^N b| + q |\partial_s \partial_\theta Z^N b| + \frac{q}{s} |Z^N \partial_\theta^2 b| \right) \\ &\quad \min \left(\frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}}, \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}(1+s)^{\frac{1}{2}}} \right) \left(s |\partial_s^2 Z^N b| + q |\partial_s^2 \partial_\theta Z^N b| \right. \\ &\quad \left. + \frac{q}{s} |Z^N \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^N \partial_\theta^3 b| \right). \end{aligned}$$

We have

$$\left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)} \bar{\partial} Z^N \tilde{g} \right\|_{L^2} \lesssim \left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+s)(1+|q|)^\sigma} \bar{\partial} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}+\rho}} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2},$$

and so

$$\int_0^t \varepsilon^{-1}(1+t) \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \lesssim \varepsilon \int_0^t (1+t)^{-2\rho} \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 \lesssim \varepsilon^3(1+t)^{2\rho}.$$

We proceed in a similar way for the other terms involving \tilde{g} . The term $\frac{\varepsilon}{(1+s)(1+|q|)^{2+\delta-\rho}} s |\partial_s \partial_\theta Z^N b|$ can be estimated like (9.13). We estimate

$$\begin{aligned} \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+s)^2(1+|q|)^{1+\delta-\rho}} Z^N \partial_\theta^2 b \right\|_{L^2} &\lesssim \left(\int \frac{\varepsilon^2}{(1+s)^4(1+|q|)^{2\sigma-\rho}} \|Z^N b\|_{H^2(\mathbb{S}^1)}^2 r dr \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon^4}{1+t}. \end{aligned}$$

We now estimate

$$\left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}(1+s)^{\frac{1}{2}}} s \partial_s^2 \partial_\theta Z^N b \right\|_{L^2} \lesssim \varepsilon \left(\int \frac{1}{(1+|q|)^{1+2\sigma}} s \|\partial_s^2 Z^N b\|_{H^1(\mathbb{S}^1)}^2 r dr \right)^{\frac{1}{2}},$$

and so

$$\int_0^t \varepsilon^{-1}(1+t) \left\| w_2^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta-\sigma}(1+s)^{\frac{1}{2}}} s \partial_s^2 \partial_\theta^N b \right\|_{L^2}^2 \lesssim \varepsilon \int_0^t (1+s)^3 \|\partial_s^2 Z^N b\|_{H^1(\mathbb{S}^1)}^2 \lesssim \varepsilon^2 (1+t)^{2\rho}.$$

The other terms can be estimated in the same way.

We now treat the terms Q_{LL} and Q_{UL} . We start with $\partial_q \tilde{g}_{LL} \partial_s Z^N \tilde{g}_{LL}$

$$\begin{aligned} & \int w_2 \partial_q \tilde{g}_{LL} \partial_s Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1 dx \\ &= -\partial_t \int w_2 \partial_q \tilde{g}_{LL} Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1 dx - \int w_2 \partial_s \partial_q \tilde{g}_{LL} Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1 dx \\ & \quad - \partial_t \int w_2 \partial_q \tilde{g}_{LL} Z^N \tilde{g}_{LL} \partial_s Z^N \tilde{g}_1 dx + \int \partial_t (w_2 \partial_q \tilde{g}_{LL} Z^N \tilde{g}_{LL}) \partial_s Z^N \tilde{g}_1 dx. \end{aligned}$$

We estimate

$$\begin{aligned} \left| \int w_2 \partial_q \tilde{g}_{LL} Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1 dx \right| &\lesssim \int \frac{\varepsilon w_2}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} |Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1| \\ &\lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}-\rho}} \left\| \frac{w_2^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g}_{LL} \right\|_{L^2} \left\| w_2^{\frac{1}{2}} \partial_t Z^N \tilde{g}_1 \right\|_{L^2} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-3\rho}}, \end{aligned}$$

$$\begin{aligned} \left| \int w_2 \partial_s \partial_q \tilde{g}_{LL} Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1 dx \right| &\lesssim \int \frac{\varepsilon w_2}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^N \tilde{g}_{LL} \partial_t Z^N \tilde{g}_1| \\ &\lesssim \frac{\varepsilon}{(1+t)^{\frac{3}{2}-\rho}} \left\| \frac{w_2^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g}_{LL} \right\|_{L^2} \left\| w_2^{\frac{1}{2}} \partial_t Z^N \tilde{g}_1 \right\|_{L^2} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{3}{2}-3\rho}}, \end{aligned}$$

$$\left| \int w_2 \partial_q \tilde{g}_{LL} \partial_t Z^N \tilde{g}_{LL} \partial_s Z^N \tilde{g}_1 dx \right| \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}-\rho}} \left\| w_2'(q)^{\frac{1}{2}} \partial Z^N \tilde{g}_{LL} \right\|_{L^2} \left\| w_2'(q)^{\frac{1}{2}} \partial_s Z^N \tilde{g}_1 \right\|_{L^2},$$

and consequently

$$\int_0^t \left| \int w_2 \partial_q \tilde{g}_{LL} \partial_t Z^N \tilde{g}_{LL} \partial_s Z^N \tilde{g}_1 dx \right| \lesssim \varepsilon^3 (1+t)^{2\rho}.$$

The term $\partial_q \tilde{g}_{LL} \partial_U \tilde{g}_{LL}$ is similar to estimate. We now turn to $\partial_q \tilde{g}_{LL} \partial_s \sigma_{UL}^0$. We follow the same calculation, noticing that in the region $q > R$ we have the estimate (3.44) for $\partial_q \tilde{g}_{LL}$

$$\begin{aligned} \left| \int w_2 \partial_q \tilde{g}_{LL} Z^N \sigma_{UL}^0 \partial_t Z^N \tilde{g}_1 dx \right| &\lesssim \int \frac{\varepsilon w_2}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} |Z^N \sigma_{UL}^0 \partial_t Z^N \tilde{g}_1| \\ &\lesssim \varepsilon \left\| w_2^{\frac{1}{2}} \partial_t Z^N \tilde{g}_1 \right\|_{L^2} \left(\int \frac{1}{(1+|q|)^{1+\sigma}} (1+s)^{2+2\rho} \|\partial_s Z^N b\|_{L^2}^2 dr \right)^{\frac{1}{2}} \\ &\lesssim \varepsilon^3 (1+t)^{2\rho}, \end{aligned}$$

where we have used (2.13) and (2.10).

$$\begin{aligned} \left| \int w_2 \partial_s \partial_q \tilde{g}_{LL} Z^N \sigma_{UL}^0 \partial_t Z^N \tilde{g}_1 dx \right| &\lesssim \int \frac{\varepsilon w_2}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{\frac{3}{2}+\delta}} |Z^N \sigma_{UL}^0 \partial_t Z^N \tilde{g}_1| \\ &\lesssim \varepsilon \left\| w_2^{\frac{1}{2}} \partial_t Z^N \tilde{g}_1 \right\|_{L^2} \left(\int \frac{1}{(1+|q|)^{1+\sigma}} (1+s)^{2\rho} \|\partial_s Z^N b\|_{L^2}^2 dr \right)^{\frac{1}{2}} \end{aligned}$$

and consequently

$$\int_0^t \left| \int w_2 \partial_s \partial_q \tilde{g}_{LL} Z^N \sigma_{UL}^0 \partial_t Z^N \tilde{g}_1 dx \right| \lesssim \int_0^t \frac{\varepsilon}{1+t} \left\| w_2^{\frac{1}{2}} \partial_t Z^N \tilde{g}_1 \right\|_{L^2}^2 + \varepsilon \int_0^t (1+t)^{1+2\rho} \|\partial_s Z^N b\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho}.$$

$$\begin{aligned} & \left| \int \partial_t (w_2 \partial_q \tilde{g}_{LL} Z^N \sigma_{UL}^0) \partial_s Z^N \tilde{g}_1 dx \right| \\ & \lesssim \int \frac{\varepsilon w_2}{(1+s)^{\frac{1}{2}-\rho} (1+|q|)^{\frac{3}{2}+\delta}} \left(\frac{1}{1+|q|} |Z^N \sigma_{UL}^0| + |\partial_s Z^N \sigma_{UL}^0| \right) |\partial_s Z^N \tilde{g}_1| \\ & \lesssim \varepsilon \left\| w_2'(q)^{\frac{1}{2}} \partial_s Z^N \tilde{g}_1 \right\|_{L^2} \left(\int \frac{1}{(1+|q|)^\sigma} \left(\frac{1}{1+|q|} (1+s)^{2+2\rho} \|\partial_s Z^N b\|_{L^2(\mathbb{S}^2)}^2 + (1+s)^{2+2\rho} \|\partial_s^2 Z^N b\|_{L^2(\mathbb{S}^1)}^2 \right) dr \right)^{\frac{1}{2}} \end{aligned}$$

and consequently

$$\begin{aligned} & \int_0^t \left| \int w_2 \partial_q \tilde{g}_{LL} \partial_t Z^N \tilde{g}_{LL} \partial_s Z^N \tilde{g}_1 dx \right| \\ & \lesssim \varepsilon \int_0^t \left\| w_2'(q)^{\frac{1}{2}} \partial_s Z^N \tilde{g}_1 \right\|_{L^2}^2 + \int_0^t (1+s)^{2+2\rho} \|\partial_s Z^N b\|_{L^2(\mathbb{S}^2)}^2 + (1+s)^3 \|\partial_s^2 Z^N b\|_{L^2(\mathbb{S}^2)}^2 \\ & \lesssim \varepsilon^3 (1+t)^{2\rho}. \end{aligned}$$

We now turn to the term $s\chi'(q)\partial_s^2 Z^N b$. We cannot do the same reasoning as before because of estimate

$$\begin{aligned} & \square_g g_{LL} \left(\Upsilon \left(\frac{r}{t} \right) (\chi(q) - 1) s \partial_s Z^N b \right) \\ & = s \chi'(q) \partial_s^2 Z^N b + O \left(\Upsilon \left(\frac{r}{t} \right) \partial_s \partial_\theta Z^N b \right) + O \left(\frac{1}{r} \Upsilon \left(\frac{r}{t} \right) \partial_s \partial_\theta^2 Z^N b \right) \\ & \quad + O \left(\tilde{g}_{LL} \Upsilon \left(\frac{r}{t} \right) s \partial_s^3 Z^N b \right). \end{aligned}$$

We estimate

$$\begin{aligned} \int_0^t (1+\tau) \varepsilon^{-1} \left\| w_2^{\frac{1}{2}} \Upsilon \left(\frac{r}{t} \right) \partial_s \partial_\theta Z^N b \right\|_{L^2}^2 & \lesssim \int_0^t \int (1+\tau) \varepsilon^{-1} \Upsilon \left(\frac{r}{t} \right)^2 \frac{1}{(1+|q|)^{1+2\sigma}} \|\partial_s \partial_\theta Z^N b\|_{L^2(\mathbb{S}^1)}^2 r dr d\tau \\ & \lesssim \int_0^t (1+s)^2 \|\partial_s \partial_\theta Z^N b\|_{L^2(\mathbb{S}^1)}^2 ds \\ & \lesssim \varepsilon^3 (1+t)^{2\rho}, \end{aligned}$$

$$\begin{aligned} \int_0^t (1+\tau) \left\| w_2^{\frac{1}{2}} \frac{1}{r} \Upsilon \left(\frac{r}{t} \right) \partial_s \partial_\theta^2 Z^N b \right\|_{L^2}^2 & \lesssim \int_0^t \int (1+\tau) \varepsilon^{-1} \Upsilon \left(\frac{r}{t} \right)^2 \frac{1}{r^2 (1+|q|)^{1+2\sigma}} \|\partial_s \partial_\theta Z^N b\|_{L^2(\mathbb{S}^1)}^2 r dr d\tau \\ & \lesssim \int_0^t \varepsilon^{-1} \|\partial_s \partial_\theta^2 Z^N b\|_{L^2(\mathbb{S}^1)}^2 \\ & \lesssim \varepsilon^3 (1+t)^{2\rho}, \end{aligned}$$

$$\begin{aligned} \int_0^t (1+\tau) \varepsilon^{-1} \left\| w_2^{\frac{1}{2}} \tilde{g}_{LL} \Upsilon \left(\frac{r}{t} \right) s \partial_s^3 Z^N b \right\|_{L^2}^2 & \lesssim \int_0^t (1+\tau) \varepsilon^{-1} \frac{1}{(1+|q|)^{1+2\sigma}} \left(\frac{\varepsilon(1+|q|)}{(1+s)^{\frac{3}{2}-\rho}} s \|\partial_s^3 Z^N b\|_{L^2(\mathbb{S}^1)} \right)^2 r dr d\tau \\ & \lesssim \int_0^t \varepsilon^{-1} (1+s)^{3-\sigma} \|\partial_s^3 Z^N b\|_{L^2(\mathbb{S}^1)}^2 \\ & \lesssim \varepsilon^3 (1+t)^{2\rho}. \end{aligned}$$

We now check that $g_{LL} \left(\Upsilon \left(\frac{r}{t} \right) (\chi(q) - 1) s \partial_s Z^N b \right)$ satisfy the same estimates than \tilde{g}_1 . We have

$$\begin{aligned} & \left\| w_2^{\frac{1}{2}} g_{LL} \partial_q \left(\Upsilon \left(\frac{r}{t} \right) (\chi(q) - 1) s \partial_s Z^N b \right) \right\|_{L^2}^2 \\ & \lesssim \int \frac{1}{(1+|q|)^{1+\sigma}} \|\partial_s Z^N b\|_{L^2(\mathbb{S}^1)}^2 r dr + \int \chi'(q) s^2 \|\partial_s Z^N b\|_{L^2(\mathbb{S}^1)}^2 r dr + s.t. \\ & \lesssim \varepsilon^2 (1+t)^{2\rho}, \end{aligned}$$

where we have used (2.10) and (2.11). We estimate

$$\begin{aligned} & \int_0^t \left\| w_2'(q) \bar{\partial} g_{LL} \left(\Upsilon \left(\frac{r}{t} \right) (\chi(q) - 1) s \partial_s Z^N b \right) \right\|_{L^2}^2 \lesssim \int_0^t \int \frac{1}{(1+|q|)^{2+2\sigma}} s^2 \|\partial_s^2 Z^N b\|_{L^2(\mathbb{S}^1)}^2 r dr \\ & \lesssim \int_0^t (1+s)^3 \|\partial_s^2 Z^N b\|_{L^2(\mathbb{S}^1)}^2 ds \\ & \lesssim \varepsilon^2 (1+t)^{2\rho}, \end{aligned}$$

which concludes the proof of Proposition 9.5. \square

9.3 Estimate of $\partial Z^N \phi$ and $\partial \bar{\partial} Z^N \phi$

Proposition 9.6. *We have*

$$\begin{aligned} & \left\| w^{\frac{1}{2}} \partial Z^N \phi \right\|_{L^2} + \left\| w^{\frac{1}{2}} \partial^2 Z^N \phi \right\|_{L^2} \leq C_0 \varepsilon + C \varepsilon^{\frac{3}{2}} (1+t)^\rho, \\ & \int_0^t \left\| w'(q)^{\frac{1}{2}} \bar{\partial} Z^N \phi \right\|_{L^2} + \left\| w'(q)^{\frac{1}{2}} \bar{\partial} \partial Z^N \phi \right\|_{L^2} \leq C_0 \varepsilon + C \varepsilon^{\frac{3}{2}} (1+t)^\rho. \end{aligned}$$

Proof. As in the previous section, we use the weighted energy estimate in the metric g . Thanks to Proposition 5.2, we have

$$\begin{aligned} |\square_g Z^I \phi| & \lesssim \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} |Z^I \tilde{g}_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I \tilde{g}| \\ & + \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial Z^I \phi| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| + \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} Z^I \phi|. \end{aligned}$$

We estimate

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} Z^N \tilde{g}_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon}{\sqrt{1+t}} \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^N \tilde{g}_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon}{\sqrt{1+t}} \left\| w_2'(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_{LL} \right\|_{L^2},$$

so

$$\int_0^t \varepsilon^{-1} (1+t) \left\| w^{\frac{1}{2}} \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} Z^N \tilde{g}_{LL} \right\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho}, \quad (9.26)$$

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{1}{(1+s)^{\frac{3}{2}}} \left\| \frac{w_1^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-2\rho}}, \quad (9.27)$$

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} \partial Z^N \phi \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-2\rho}}, \quad (9.28)$$

$$\begin{aligned}
\left\| \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I G^L| \right\|_{L^2} &\lesssim \varepsilon \left(\int \frac{1}{(1+s)^3(1+|q|)^{1-8\rho}} \|Z^I G^L\|_{L^2(\mathbb{S}^2)}^2 r dr \right)^{\frac{1}{2}} \\
&\lesssim \varepsilon \left(\int \frac{1}{(1+s)^4(1+|q|)^{1-8\rho}} \|r Z^I G^L\|_{L^2(\mathbb{S}^2)}^2 dr \right)^{\frac{1}{2}} \\
&\lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}}},
\end{aligned} \tag{9.29}$$

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} \bar{\partial} Z^N \phi \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+s)^{1-\mu}} \left\| w'(q)^{\frac{1}{2}} \bar{\partial} Z^N \phi \right\|_{L^2},$$

so

$$\int_0^t \varepsilon^{-1}(1+t) \left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} \bar{\partial} Z^N \phi \right\|_{L^2}^2 \lesssim \varepsilon \int_0^t \left\| w'(q)^{\frac{1}{2}} \bar{\partial} Z^N \phi \right\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho}. \tag{9.30}$$

Estimates (9.26), (9.27), (9.26), (9.29) and (9.30) conclude the first part of Proposition 9.6. We now estimate $\partial Z^N \phi$. The terms are all similar or easier to estimate, since no terms with two derivatives of g are involved. The terms involving a derivative of G^L can be estimated by

$$\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^N G^L|, \quad \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |\bar{\partial} Z^N G^L|.$$

The contribution of the second term can be estimated (very roughly) with an integration by part as in the last section (see estimates (9.16), (9.17), (9.18) and (9.19)). \square

9.4 Estimate of $\partial Z^{N+1} \phi$

Proposition 9.7. *We have*

$$\begin{aligned}
\left\| w^{\frac{1}{2}} \partial Z^{N+1} \phi \right\|_{L^2} &\leq C_0 \varepsilon + C \varepsilon^{\frac{3}{2}} (1+t)^{\frac{1}{2}+\rho}, \\
\int \frac{1}{1+t} \left\| w'(q)^{\frac{1}{2}} \bar{\partial} Z^{N+1} \phi \right\|_{L^2}^2 &\leq C_0^2 \varepsilon^2 + C \varepsilon^3 (1+t)^\rho.
\end{aligned}$$

Proof. We use the weighted energy estimate in the metric g and multiply it by $\frac{1}{1+t}$. We obtain

$$\begin{aligned}
&\frac{d}{dt} \left(\frac{1}{1+t} \int (\partial Z^{N+1} \phi)^2 w_1(q) \right) + C \frac{1}{1+t} \int w'(q) (\bar{\partial} Z^{N+1} \phi)^2 \\
&\lesssim \frac{\varepsilon}{1+t} \frac{1}{1+t} \int w_1(q) (\partial Z^{N+1} \phi)^2 + \frac{1}{1+t} \left| \int w_1(q) \partial_t Z^{N+1} \phi \square_g Z^{N+1} \phi \right|.
\end{aligned}$$

To estimate $\square_g Z^{N+1} \phi$ we use Proposition 5.2 and remark that

$$|Z^{N+1} g| \lesssim (1+s) |\bar{\partial} g| + (1+|q|) |\partial g|.$$

Consequently

$$\begin{aligned}
|\square_g Z^{N+1} \phi| &\lesssim \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{5}{2}-4\rho}} |\bar{\partial} Z^N \tilde{g}_{LL}| + \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} |\partial Z^N \tilde{g}_{LL}| \\
&+ \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} |\bar{\partial} Z^N \tilde{g}_1| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |\partial Z^N \tilde{g}| \\
&+ \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial Z^{N+1} \phi| + \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |\bar{\partial} Z^N G^L| \\
&+ \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^N G^L| + \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} Z^{N+1} \phi|.
\end{aligned}$$

We estimate the first term. It comes from a term of the form $s\bar{\partial}Z^N\tilde{g}_{LL}\partial_q^2\phi$. We estimate its contribution with an integration by part

$$\begin{aligned}
& \int_0^t \frac{1}{1+\tau} \int w(q) s \bar{\partial} Z^N \tilde{g}_{LL} \partial_q^2 \phi \partial_t Z^{N+1} \phi \\
&= \left[\frac{1}{1+t} \int w(q) s \bar{\partial} Z^N \tilde{g}_{LL} \partial_q^2 \phi Z^{N+1} \phi \right]_0^t - \int \int \partial_t \left(w(q) \frac{s}{1+\tau} \bar{\partial} Z^N \tilde{g}_{LL} \partial_q^2 \phi \right) Z^{N+1} \phi \\
&= \left[\frac{1}{1+\tau} \int w(q) s \bar{\partial} Z^N \tilde{g}_{LL} \partial_q^2 \phi Z^{N+1} \phi \right]_0^t + \int \int \partial_t \left(w(q) \frac{s}{1+\tau} Z^N \tilde{g}_{LL} \partial_q^2 \phi \right) \bar{\partial} Z^{N+1} \phi \\
&\quad + O \left(\int \int \frac{1}{(1+s)^2} |\partial_t (w(q) s Z^N \tilde{g}_{LL} \partial_q^2 \phi) Z^{N+1} \phi| \right) + O \left(\left[\int \partial_t \left(w(q) \frac{s}{1+\tau} Z^N \tilde{g}_{LL} \partial_q^2 \phi \right) Z^{N+1} \phi \right]_0^t \right).
\end{aligned}$$

We estimate

$$\begin{aligned}
& \frac{1}{1+t} \left| \int w(q) s \bar{\partial} Z^N \tilde{g}_{LL} \partial_q^2 \phi Z^{N+1} \phi \right| \\
&\lesssim \frac{1}{1+t} \int w(q) \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{5}{2}-4\rho}} |\bar{\partial} Z^N \tilde{g}_{LL}| |Z^{N+1} \phi| \\
&\lesssim \varepsilon \frac{1}{\sqrt{1+t}} \left\| w_2(q)^{\frac{1}{2}} \partial Z^N \tilde{g}_2 \right\|_{L^2} \left\| w(q)^{\frac{1}{2}} \partial Z^{N+1} \phi \right\|_{L^2} \\
&\lesssim \varepsilon^3 (1+t)^{2\rho},
\end{aligned}$$

$$\begin{aligned}
& \left| \int \int \partial_t \left(w(q) \frac{s}{1+\tau} Z^N \tilde{g}_{LL} \partial_q^2 \phi \right) \bar{\partial} Z^{N+1} \phi \right| \\
&\lesssim \int \int \frac{1}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{5}{2}-4\rho}} \left(|\partial Z^N g_{LL}| + \frac{1}{1+|q|} |Z^N g_{LL}| \right) |\bar{\partial} Z^{N+1} \phi| \\
&\lesssim \varepsilon \int_0^t \left\| w'_2(q) \left(|\partial Z^N g_{LL}| + \frac{1}{1+|q|} |Z^N g_{LL}| \right) \right\|_{L^2}^2 + \varepsilon \int_0^t \frac{1}{1+\tau} \left\| w'(q) \bar{\partial} Z^{N+1} \phi \right\|_{L^2}^2 \\
&\lesssim \varepsilon^3 (1+t)^{2\rho},
\end{aligned}$$

where we have used (3.17), (4.13) and (4.14),

$$\begin{aligned}
& \left| \int_0^t \int \frac{1}{(1+s)^2} \partial_t (w(q) s \bar{\partial} Z^N \tilde{g}_{LL} \partial_q^2 \phi) Z^{N+1} \phi \right| \\
&\lesssim \int_0^t \int \frac{\varepsilon}{(1+s)^{\frac{3}{2}} (1+|q|)^{\frac{5}{2}-4\rho}} \left(|\partial Z^N g_{LL}| + \frac{1}{1+|q|} |Z^N g_{LL}| \right) |Z^{N+1} \phi| \\
&\lesssim \varepsilon \int_0^t \left\| w'_2(q) \left(|\partial Z^N g_{LL}| + \frac{1}{1+|q|} |Z^N g_{LL}| \right) \right\|_{L^2}^2 + \varepsilon \int_0^t \frac{1}{(1+\tau)^3} \left\| w^{\frac{1}{2}} \frac{Z^{N+1} \phi}{1+|q|} \right\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho}.
\end{aligned}$$

The last term can be estimated as the first. For the estimate of the other terms, we refer to the following section. \square

9.5 Estimation of $\partial SZ^N \phi$

Proposition 9.8. *We have*

$$\left\| w^{\frac{1}{2}} \partial (SZ^N \phi - s \partial_q \phi Z^N g_{LL}) \right\|_{L^2} \leq C_0 \varepsilon + C \varepsilon^{\frac{3}{2}} (1+t)^\rho,$$

$$\int_0^t \left\| w'(q)^{\frac{1}{2}} \bar{\partial}(SZ^N \phi - s \partial_q \phi Z^N g_{LL}) \right\|_{L^2} \leq C_0 \varepsilon + C \varepsilon^{\frac{3}{2}} (1+t)^\rho.$$

We do the weighted energy estimate in the metric g . We have, thanks to Proposition 5.2

$$\begin{aligned} |\square_g SZ\phi| &\lesssim \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{5}{2}-4\rho}} |\partial_s Z^N \tilde{g}_{LL}| + \frac{\varepsilon}{\sqrt{1+s} (1+|q|)^{\frac{3}{2}-4\rho}} |\partial Z^N \tilde{g}_{LL}| \\ &\quad + \frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{3}{2}-4\rho}} |\bar{\partial} Z^N \tilde{g}_1| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}} (1+|q|)^{\frac{1}{2}-4\rho}} |\partial Z^N \tilde{g}| \\ &\quad + \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |\partial SZ^N \phi| + \frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{1}{2}-4\rho}} |\partial_s Z^N G^L| \\ &\quad + \frac{\varepsilon}{(1+s)^{\frac{3}{2}} (1+|q|)^{\frac{1}{2}-4\rho}} |Z^N G^L| + \frac{\varepsilon}{(1+s) \sqrt{1+|q|}} |\bar{\partial} SZ^N \phi| \end{aligned}$$

We estimate the first term. It can be written $s \partial_s Z^N g_{LL} \partial_q^2 \phi$. We remark the following calculation

$$\begin{aligned} \square_g s \partial_q \phi Z^N g_{LL} &= Z^N g_{LL} \square_g (s \partial_q \phi) + s \partial_q \phi \square_g Z^N g_{LL} + g^{\alpha\beta} \partial_\alpha (s \partial_q \phi) \partial_\beta Z^N g_{LL} \\ &= O \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{5}{2}-4\rho}} \right) Z^N g_{LL} + s \partial_q \phi \square_g Z^N g_{LL} \\ &\quad + \partial_s Z^N g_{LL} \partial_q (s \partial_q \phi) + \partial_q Z^N g_{LL} \partial_s (s \partial_q \phi) + \frac{1}{r^2} \partial_\theta Z^N g_{LL} \partial_\theta (s \partial_q \phi) \\ &\quad + \tilde{g} \bar{\partial} (s \partial_q \phi) \partial_q Z^N g_{LL} + \tilde{g}_{LL} \partial_q (s \partial_q \phi) \partial_s Z^N g_{LL} + \tilde{g}_{UL} \partial_q (s \partial_q \phi) \frac{\partial_\theta}{r} Z^N g_{LL}. \end{aligned}$$

In $\square_g Z^N g_{LL}$, considering the support condition on ϕ , it is sufficient to study the contribution of M_{LL} : the only dangerous terms are the one of the form $\partial_{\underline{L}} \tilde{g}_{LV} \partial_L Z^N g$ which can only be $\partial_{\underline{L}} \tilde{g}_{LL} \partial_L Z^N g_{LL}$, and the contribution of the commutator of the wave operator with the null frame, which are more precisely in this case

$$\frac{1}{r^2} \Upsilon \left(\frac{r}{t} \right) Z^N \tilde{g} + \frac{1}{r} \Upsilon \left(\frac{r}{t} \right) \bar{\partial} \tilde{g}_{LV}.$$

Consequently, the terms in $\square_g (SZ^N \phi - s \partial_q \phi Z^N g_{LL})$ are similar to one of the three following terms

$$O \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{5}{2}-4\rho}} \right) Z^N g_{LL}, \quad O \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{3}{2}-4\rho}} \right) \bar{\partial} Z^N \tilde{g}_1, \quad \tilde{g}_1 \partial_q (s \partial_q \phi) \partial_s Z^N g_{LL}.$$

We estimate the first term

$$\begin{aligned} \int_0^t \varepsilon^{-1} (1+\tau) \left\| w^{\frac{1}{2}} O \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{5}{2}-4\rho}} \right) Z^N g_{LL} \right\|_{L^2}^2 &\lesssim \varepsilon \int \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^{\frac{5}{2}-4\rho-\sigma}} Z^N g_{LL} \right\|_{L^2}^2 \\ &\lesssim \varepsilon^3 (1+t)^{2\rho}, \end{aligned} \tag{9.31}$$

where we have used (4.14). The second term is similar. We now estimate the contribution of the

third term.

$$\begin{aligned}
& \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) \partial_s Z^N g_{LL} \partial_t S Z^N \phi \\
&= \partial_t \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_t S Z^N \phi - \int \partial_s (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) r) Z^N g_{LL} \partial_t S Z^N \phi d\theta dr \\
&\quad - \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_t \partial_s S Z^N \phi dx \\
&= \partial_t \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_t S Z^N \phi - \int \partial_s (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) r) Z^N g_{LL} \partial_t S Z^N \phi d\theta dr \\
&\quad - \partial_t \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_s S Z^N \phi + \int \partial_t (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL}) \partial_s S Z^N \phi \\
&= \partial_t A - \int \partial_s (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) r) Z^N g_{LL} \partial_t S Z^N \phi d\theta dr + \int \partial_t (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL}) \partial_s S Z^N \phi
\end{aligned}$$

with

$$A = \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_t S Z^N \phi + \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_s S Z^N \phi.$$

We estimate

$$\begin{aligned}
& \left| \int w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL} \partial_t S Z^N \phi \right| \\
&\lesssim \int \frac{\varepsilon^2}{(1+|q|)^{2-4\rho}} |Z^N g_{LL}| |\partial_t S Z^N \phi| \\
&\lesssim \left\| \frac{w_2^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g}_1 \right\|_{L^2} \left\| w^{\frac{1}{2}} \partial_t S Z^N \phi \right\|_{L^2} \lesssim \varepsilon^4 (1+t)^{2\rho}.
\end{aligned}$$

The second term in A obey a similar estimate so

$$|A| \lesssim \varepsilon^4 (1+t)^{2\rho}.$$

We now estimate

$$\begin{aligned}
|\partial_s (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) r)| &\lesssim \frac{1}{(1+|q|)^2} |Z \tilde{g}_1| |Z^2 \phi| r \lesssim \frac{1}{(1+|q|)^2} \frac{\varepsilon (1+|q|)^{\frac{1}{2}}}{(1+s)^{\frac{1}{2}}} \frac{\varepsilon}{(1+s)^{\frac{1}{2}} (1+|q|)^{\frac{1}{2}-4\rho}} r \\
&\lesssim \frac{\varepsilon^2}{(1+s)(1+|q|)^{2-4\rho}}.
\end{aligned}$$

Consequently

$$\begin{aligned}
& \int_0^t \left| \int \partial_s (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) r) Z^N g_{LL} \partial_t S Z^N \phi d\theta dr \right| \\
&\lesssim \int_0^t \int w(q) \frac{\varepsilon^2}{(1+s)(1+|q|)^{2-4\rho-\sigma}} |Z^N g_{LL}| |\partial_t S Z^N \phi| dx \\
&\lesssim \int_0^t \frac{\varepsilon^2}{(1+\tau)} \left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^N g_{LL} \right\|_{L^2} \left\| w^{\frac{1}{2}} \partial_t S Z^N \phi \right\|_{L^2} \\
&\lesssim \varepsilon \int_0^t \left\| \frac{w_2(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{3}{2}}} Z^N g_{LL} \right\|_{L^2}^2 + \int_0^t \frac{\varepsilon}{(1+\tau)^2} \left\| w^{\frac{1}{2}} \partial_t S Z^N \phi \right\|_{L^2}^2 \\
&\lesssim \varepsilon^3 (1+t)^{2\rho}.
\end{aligned}$$

We now estimate

$$\begin{aligned}
& \int_0^t \left| \int \partial_t (w(q) \tilde{g}_1 \partial_q (s \partial_q \phi) Z^N g_{LL}) \partial_s S Z^N \phi \right| \\
& \lesssim \int w(q) \frac{\varepsilon^2}{(1+|q|)^{3-4\rho-\sigma}} |Z^N g_{LL}| |\partial_s S Z^N \phi| dx + s.t. \\
& \lesssim \varepsilon^2 \int_0^t \left\| \frac{w(q)^{\frac{1}{2}}}{(1+|q|)^{\frac{5}{2}-4\rho-\sigma-\mu}} Z^N g_{LL} \right\|_{L^2} \left\| \frac{w^{\frac{1}{2}}}{(1+|q|)^{\frac{1}{2}+\mu}} \partial_s S Z^N \phi \right\|_{L^2} \\
& \lesssim \varepsilon \int_0^t \left\| \frac{w'_2(q)^{\frac{1}{2}}}{1+|q|} Z^N g_{LL} \right\|_{L^2}^2 + \varepsilon \int_0^t \left\| w'(q)^{\frac{1}{2}} \partial_s S Z^N \phi \right\|_{L^2}^2 \\
& \lesssim \varepsilon^3 (1+t)^{2\rho}.
\end{aligned}$$

We now estimate the other contributions in $\square_g S Z^N \phi$. The term $\frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} |\partial Z^N \tilde{g}_{LL}|$ can be estimated like (9.31). We estimate

$$\begin{aligned}
& \int_0^t \varepsilon (1+\tau)^{-1} \left\| w \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 d\tau \lesssim \int_0^t \varepsilon \left\| w^{\frac{1}{2}}(q)' \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 \lesssim \varepsilon^2 (1+t)^{2\rho}, \\
& \left\| w \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} \partial Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{\frac{3}{2}}} \left\| w^{\frac{1}{2}} \partial Z^N \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-2\rho}}.
\end{aligned}$$

We decompose

$$\frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} S Z^N \phi| = \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial}(S Z^N \phi - s \partial_q \phi Z^N g_{LL})| + \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} |\bar{\partial} s \partial_q \phi Z^N g_{LL}|.$$

We estimate

$$\int_0^t \varepsilon (1+t)^{-1} \left\| \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} \bar{\partial}(S Z^N \phi - s \partial_q \phi Z^N g_{LL}) \right\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho},$$

thanks to (3.16), and

$$\begin{aligned}
& \int_0^t \varepsilon (1+t)^{-1} \left\| \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} \bar{\partial} s \partial_q \phi Z^N g_{LL} \right\|_{L^2}^2 \\
& \lesssim \int_0^t \varepsilon (1+t)^{-1} \left\| \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} \bar{\partial} Z^N g_{LL} \right\|_{L^2}^2 \\
& \lesssim \int_0^t \varepsilon \left\| w'_2(q)^{\frac{1}{2}} \bar{\partial} Z^N g_{LL} \right\|_{L^2}^2 \lesssim \varepsilon^3 (1+t)^{2\rho}.
\end{aligned}$$

The other term can be estimated in a similar way. For the term involving $\bar{\partial} G^L$ we refer to (9.16), (9.17), (9.18) and (9.19).

10 Lower order L^2 estimates

10.1 Estimate of $\partial Z^{N-1} \phi$

Proposition 10.1. *We have*

$$\left\| w^{\frac{1}{2}} \partial Z^{N-1} \phi \right\|_{L^2} \lesssim C_0 \varepsilon + C \varepsilon^{\frac{3}{2}}.$$

Proof. We perform the energy estimate in the Minkowski metric. Estimates (9.27) to (9.30) are quite loose, so the only term we need to estimate is

$$\left\| \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{5}{2}-4\rho}} |Z^{N-1}\tilde{g}_{LL}| \right\|_{L^2} \lesssim \frac{\varepsilon}{\sqrt{1+t}} \left\| \frac{w_2^{\frac{1}{2}}}{(1+|q|)^2} Z^{N-1}\tilde{g}_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-\rho}},$$

where we have used (4.16). \square

10.2 Estimate of $\partial Z^{N-3}\tilde{g}$

Proposition 10.2. *We have*

$$\begin{aligned} \left\| w^{\frac{1}{2}} \partial Z^{N-3}\tilde{g} \right\|_{L^2} &\leq C_0\varepsilon + C\varepsilon^{\frac{3}{2}}(1+t)^\rho, \\ \left\| w^{\frac{1}{2}} \partial Z^{N-3}k \right\|_{L^2} &\leq C\varepsilon^{\frac{3}{2}}(1+t)^\rho. \end{aligned}$$

Proof. We use the weighted energy estimate in the metric g

$$\frac{d}{dt} \left\| w^{\frac{1}{2}}(q) \partial Z^{N-3}\tilde{g} \right\|_{L^2}^2 + C \left\| w'(q)^{\frac{1}{2}} \bar{\partial} Z^{N-3}\tilde{g} \right\|_{L^2}^2 \lesssim \left| \int w(q) \square_g Z^{N-3}\tilde{g} \partial_t Z^{N-3}\tilde{g} \right| + \frac{\varepsilon}{1+t} \left\| w^{\frac{1}{2}} \partial Z^{N-3}\tilde{g} \right\|_{L^2}^2.$$

We use Proposition (5.1) to estimate $\square_g Z^{N-1}\tilde{g}$. We start with Q_{LL} .

$$\begin{aligned} |Q_{LL}| &\lesssim \frac{\varepsilon}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}} \left(|\bar{\partial} Z^I \tilde{g}_1| + \frac{1}{1+|q|} |Z^I g_{LL}| \right) + \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| \\ &+ \varepsilon \min \left(\frac{1}{(1+|q|)(1+s)^{\frac{1}{2}-\rho}}, \frac{1}{(1+|q|)^{\frac{1}{2}}(1+s)^{\frac{1}{2}}} \right) (|\bar{\partial} Z^I \tilde{g}| + |Z^I G^L|) \\ &+ \mathbb{1}_{q>R} \min \left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{5}{2}+\delta}}, \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{5}{2}+\delta+\sigma}} \right) \frac{q}{s} |Z^I \partial_\theta^2 b| + \mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}_1| \\ &+ \mathbb{1}_{q>R} \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}+\delta}(1+s)^{\frac{1}{2}-\rho}} \left(s |\partial_s^2 Z^I b| + q |\partial_s^2 \partial_\theta Z^I b| + \frac{q}{s} |Z^I \partial_s \partial_\theta^2 b| + \frac{q}{s^2} |Z^I \partial_\theta^3 b| \right) \\ &\lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} |Z^{I+1}\tilde{g}| + \frac{\varepsilon}{(1+|q|)^2(1+s)^{\frac{1}{2}-\rho}} |Z^I g_{LL}| \\ &+ \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} + \frac{\varepsilon}{(1+s)(1+|q|)^{1-4\rho}} \right) |\partial Z^I \tilde{g}_1| \\ &+ \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)} |Z^I G^L| + \mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}|, \end{aligned}$$

where we have used the fact that

$$|\partial_\theta^3 Z^{N-3}b| \lesssim \|\partial_\theta^3 Z^{N-3}b\|_{H^1(\mathbb{S}^1)} \lesssim \|Z^{N-1}b\|_{H^1(\mathbb{S}^1)} \lesssim \varepsilon,$$

thanks to (2.3),

$$|\partial_s^2 \partial_\theta Z^{N-3}b| \lesssim \frac{1}{1+s} \|\partial_s Z^{N-1}b\|_{H^1(\mathbb{S}^1)} \lesssim \frac{\varepsilon}{(1+s)^{3-\frac{1}{4}}},$$

and thanks to (2.4), to say that to estimate the terms involving b , it is sufficient to estimate

$$\mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}|.$$

We estimate

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)} Z^{I+1} \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho-\sigma}} \left\| \frac{w_1^{\frac{1}{2}}}{1+|q|} Z^{I+1} \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-3\rho-\sigma}}, \quad (10.1)$$

thanks to (3.58).

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+|q|)^2(1+s)^{\frac{1}{2}-\rho}} Z^I g_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho-\sigma}} \left\| \frac{w_1^{\frac{1}{2}}}{(1+|q|)^2} Z^I g_{LL} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-4\rho-\sigma}}, \quad (10.2)$$

thanks to Proposition 4.5. We estimate

$$\left\| w^{\frac{1}{2}} \frac{\varepsilon}{(1+s)\sqrt{1+|q|}} \partial Z^{N-3} \tilde{g}_1 \right\|_{L^2} \lesssim \frac{1}{1+t} \left\| w^{\frac{1}{2}} \partial Z^{N-3} \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}, \quad (10.3)$$

$$\begin{aligned} & \left\| \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)} Z^{N-3} G^L \right\|_{L^2} \\ & \lesssim \left(\int \frac{\varepsilon}{(1+s)^{2-2\rho}(1+|q|)^2} \|r Z^{N-3} G^L\|_{L^2(\mathbb{S}^1)}^2 dr \right)^{\frac{1}{2}} \\ & \lesssim \left(\int \frac{\varepsilon}{(1+s)^{2-2\rho}(1+|q|)^2} \left(\frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-\rho}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \frac{\varepsilon\sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)} \right)^2 dr \right)^{\frac{1}{2}}, \end{aligned}$$

so

$$\left\| \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)} Z^{N-3} G^L \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}. \quad (10.4)$$

We estimate

$$\left\| w^{\frac{1}{2}} \mathbb{1}_{q>R} \frac{\varepsilon}{1+s} |\partial Z^I \tilde{g}| \right\|_{L^2} \lesssim \frac{\varepsilon}{1+t} \left\| w^{\frac{1}{2}} \partial Z^I \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)^{1-\rho}}. \quad (10.5)$$

We now go to the other terms in $\square_g Z^{N-3} \tilde{g}$. The contribution of ${}^I M^E$ can be estimated by (10.5). To estimate the contribution of R^1 , it is sufficient to consider

$$\mathbb{1}_{R \leq q \leq R+1} \partial_s Z^{I+2} b = O \left(\mathbb{1}_{R \leq q \leq R+1} \frac{\varepsilon^2}{(1+s)^{2-\frac{1}{4}}} \right),$$

and we have

$$\left\| w^{\frac{1}{2}} c h_{R \leq q \leq R+1} \partial_s Z^{I+2} b \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-\frac{1}{4}}}. \quad (10.6)$$

The terms in ${}^I M$ can be estimated by (10.1) and (10.2), except

$$\frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} |Z^I \tilde{g} \tau \tau|, \quad \frac{1}{1+s} |Z^{I+1} G|.$$

The first term can be estimated by (10.3), and the second one

$$\begin{aligned}
& \left\| w^{\frac{1}{2}} \frac{1}{1+s} Z^{I+1} G^L \right\|_{L^2} \\
& \lesssim \left(\int \frac{1}{(1+s)^3} \|r Z^{I+1} G^L\|_{L^2(\mathbb{S}^1)}^2 dr \right)^{\frac{1}{2}} \\
& \lesssim \left(\int \frac{1}{(1+s)^3} \left(\frac{\varepsilon^2}{(1+t)^{\frac{1}{2}-\rho}} + \frac{\varepsilon^2}{(1+|q|)^{1-4\rho}} + \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)} \right)^2 dr \right)^{\frac{1}{2}} \quad (10.7) \\
& \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-\rho}}.
\end{aligned}$$

Estimates (10.1), (10.2), (10.3), (10.4), (10.5), (10.6) and (10.7) yield

$$\left\| w^{\frac{1}{2}} \square_g Z^{N-3} \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}.$$

We also have

$$\left\| w^{\frac{1}{2}} \square_g Z^{N-3} k \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}},$$

which concludes the proof of Proposition 10.2. \square

10.3 Estimate of $\partial Z^{N-4} \tilde{g}_1$

Proposition 10.3. *We have*

$$\left\| w_1^{\frac{1}{2}} \partial Z^{N-4} \tilde{g}_1 \right\|_{L^2} \lesssim C_0 \varepsilon + C \varepsilon^{\frac{5}{4}}.$$

Proof. We use the weighted energy estimate in the flat metric

$$\frac{d}{dt} \left\| w_1(q)^{\frac{1}{2}} \partial Z^{N-3} \tilde{g}_1 \right\|_{L^2}^2 + C \left\| w_1'(q)^{\frac{1}{2}} \bar{\partial} Z^{N-3} \tilde{g} \right\|_{L^2}^2 \lesssim \left| \int w_1(q) \square_g Z^{N-3} \tilde{g}_1 \partial_t Z^{N-3} \tilde{g} \right|.$$

We estimate

$$\square Z^I \tilde{g}_1 = (\square - \square_g) Z^I \tilde{g}_1 + {}^I M + {}^I Q_{\mathcal{T}\mathcal{V}} + {}^I M^E + O\left(\frac{1}{r^2} \Upsilon\left(\frac{r}{t}\right) \partial_\theta Z^I k\right).$$

The terms in ${}^I M$, ${}^I Q_{\mathcal{T}\mathcal{V}}$ and the terms in $(\square_g - \square) Z^I \tilde{g}_1$ of the form $\tilde{g} \partial^2 Z^I \tilde{g}_1$ can be estimated by (10.1), (10.2) and (10.7), except the term

$$\frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} |Z^I \tilde{g}_{\mathcal{T}\mathcal{T}}|.$$

We estimate it

$$\left\| w_1^{\frac{1}{2}} \frac{\varepsilon}{(1+s)(1+|q|)^{\frac{3}{2}-\rho}} Z^I g_{\mathcal{T}\mathcal{T}} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+t)} \left\| \frac{w_1^{\frac{1}{2}}}{(1+|q|)^{\frac{5}{4}+\sigma}} Z^I g_{\mathcal{T}\mathcal{T}} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{5}{4}}},$$

thanks to (4.16), (4.34) and (4.64). Term coming from the non commutation with the null frame

$$\left\| \frac{w_1^{\frac{1}{2}}}{(1+s)^2} Z^{I+1} k \right\|_{L^2} \lesssim \frac{1}{(1+s)^{1+\sigma}} \left\| \frac{w_1^{\frac{1}{2}}}{1+|q|} Z^{I+1} k \right\|_{L^2} \lesssim \frac{\varepsilon^{\frac{3}{2}}}{(1+t)^{1+\sigma-\rho}}.$$

The terms in M_E , and the terms in $(\square - \square_g)Z^I \tilde{g}_1$ of the form $g_b \partial^2 Z^I \tilde{g}_1$ can be estimated by

$$\mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)^2} Z^{I+1} \tilde{g}, \quad \mathbb{1}_{q>R} \frac{\varepsilon(1+|q|)}{(1+s)^2} \partial_q Z^{I+1} \tilde{g}.$$

We estimate

$$\left\| w_1^{\frac{1}{2}} \mathbb{1}_{q>R} \frac{\varepsilon}{(1+s)^2} Z^{I+1} \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon}{(1+s)^{1+\sigma}} \left\| \frac{w_1^{\frac{1}{2}}}{1+|q|} Z^{I+1} \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{1+\sigma-\rho}}.$$

We now estimate the terms coming from the non commutation with the null frame

$$\left\| \frac{w_1^{\frac{1}{2}}}{(1+s)^2} Z^{I+1} k \right\|_{L^2} \lesssim \frac{1}{(1+s)^{1+\sigma}} \left\| \frac{w_1^{\frac{1}{2}}}{1+|q|} Z^{I+1} k \right\|_{L^2} \lesssim \frac{\varepsilon^{\frac{3}{2}}}{(1+t)^{1+\sigma-\rho}}.$$

Consequently we have proved

$$\left\| w_1^{\frac{1}{2}} \square Z^{N-4} \tilde{g}_1 \right\|_{L^2} \lesssim \frac{\varepsilon^{\frac{3}{2}}}{(1+t)^{1+\sigma-\rho}},$$

which concludes the proof of Proposition 10.3. \square

10.4 Estimate of $\partial Z^{N-10} \tilde{g}_1$

Proposition 10.4. *We have*

$$\|\partial Z^{N-10} \tilde{g}_1\|_{L^2} \lesssim C_0 \varepsilon + C \varepsilon^{\frac{5}{4}}.$$

Proof. We perform the energy estimate in the flat metric. We note that in the exterior region the result is already given by Proposition 10.3. In the interior, the only place where the weight w_1 was needed, was in the estimate of the term coming from the non commutation with the null frame,

$$\Upsilon \left(\frac{r}{t} \right) \frac{\partial_\theta Z^I k}{(1+r)^2}.$$

We estimate it thanks to Corollary 7.6. For $I \leq N-10$ we have

$$\left\| \Upsilon \left(\frac{r}{t} \right) \frac{1}{(1+s)^2} Z^{I+1} k \right\|_{L^2} \lesssim \left(\int_{\frac{t}{2}}^{2t} \frac{\varepsilon^2}{(1+s)^{5-2\rho}} r dr \right)^{\frac{1}{2}} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-\rho}}.$$

\square

11 Choice of b

11.1 Proof of Proposition 3.5

Let

$$h(\theta, 2t) = 2 \int_0^\infty \Upsilon \left(\frac{r}{t} \right) (1+\beta) g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \phi dr,$$

with the metric g expressed in coordinates t, r, θ , and β defined by $\beta = 0$ at $t = T$ and

$$\partial_s \beta + \frac{1}{4} g_{LL} \partial_q \beta = -\frac{1}{2} \frac{\tilde{g}_{LL}}{r} + \partial_s O(\tilde{g}_{\mathcal{T}\mathcal{T}}),$$

More precisely, $\partial_s \beta$ is such that we can write, with the wave coordinate condition of Proposition 4.1

$$2\partial_s \beta + \frac{1}{4} g_{LL} \partial_q \beta + \partial_r g_{LL} = O(\partial_U \tilde{g}_{\mathcal{T}\mathcal{T}}) + O\left(\frac{1}{1+s} \tilde{g}_{\mathcal{T}\mathcal{T}}\right).$$

Proposition 11.1. *We have the estimates*

$$\begin{aligned}\|Z^N h(\theta, t)\|_{L^2(\mathbb{S}^1)} &\lesssim \varepsilon^2 (1+t)^\rho, \\ \|Z^{N-1} h(\theta, t)\|_{L^2(\mathbb{S}^1)} &\lesssim \varepsilon^2.\end{aligned}$$

Proof. We have

$$\begin{aligned}& \left| Z^I \left(\Upsilon \left(\frac{r}{t} \right) (1+\beta) g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \phi \right) \right| \\ & \lesssim \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{3}{2}-4\rho}} |\partial Z^I \phi| + \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} (|Z^I \tilde{g}| + |Z^I \beta|).\end{aligned}$$

We can estimate

$$\left\| \int \frac{\varepsilon \sqrt{1+s}}{(1+|q|)^{\frac{3}{2}-4\rho}} |\partial Z^I \phi| \right\|_{L^2(\mathbb{S}^1)} \lesssim \varepsilon \|\partial Z^I \phi\|_{L^2}.$$

For $I = N$ we estimate it with (3.9) and for $I = N - 1$ with (3.13).

$$\left\| \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} |Z^I \tilde{g}| \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} \left\| \frac{w_1}{1+|q|} Z^I \tilde{g} \right\|_{L^2} \lesssim \frac{\varepsilon^3}{(1+s)^{\frac{1}{2}-2\rho}},$$

thanks to (3.58). We now estimate β . We have

$$\partial_s Z^I \beta + \frac{1}{4} g_{LL} \partial_q Z^I \beta = -\frac{1}{2} \frac{Z^I \tilde{g}_{LL}}{r} + \partial_s O(\tilde{Z}^I g_{TT}) + Z^{I-J} g_{LL} \partial_q Z^J \beta.$$

Thanks to (3.52) we easily obtain that $Z^{N-13} \beta = O\left(\varepsilon \frac{\sqrt{1+|q|}}{\sqrt{1+s}}\right)$. It is equivalent to integrate with respect to s than with an affine parameter s' along the integral curve of $\partial_s + g_{LL} \partial_q \beta$. We obtain

$$Z^I \beta(q, s, \theta) = O\left(\frac{1}{r} Z^I \tilde{g}_{LL}\right) + \int_s^{2T-q} \frac{Z^I \tilde{g}_{LL}}{\rho + q} + \frac{Z^I g_{LL}}{\sqrt{\rho} \sqrt{1+|q|}} d\rho. \quad (11.1)$$

We estimate

$$\begin{aligned}& \left(\int \left(\frac{1}{(1+|r-t|)^{1+\mu}} \int_{t+r}^{2T-t+r} \frac{Z^I \tilde{g}_{LL}(\rho, r-t, \theta)}{\rho + r-t} d\rho \right)^2 dr d\theta \right)^{\frac{1}{2}} \\ & \lesssim \int_t^{2T} \left(\int \mathbb{1}_{r+t \leq \rho \leq 2T-t+r} \left(\frac{1}{(1+|r-t|)^{1+\mu}} \frac{Z^I \tilde{g}_{LL}(\rho, r-t, \theta)}{\rho + r-t} \right)^2 dr d\theta \right)^{\frac{1}{2}} d\rho \\ & \lesssim \left(\int_t^{2T} \frac{1}{\rho^{\frac{5}{4}}} d\rho \right)^{\frac{1}{2}} \left(\int_t^{2T} \int \rho^{\frac{5}{4}} \mathbb{1}_{r+t \leq \rho \leq 2T-t+r} \left(\frac{1}{(1+|r-t|)^{1+\mu}} \frac{Z^I \tilde{g}_{LL}(\rho, r-t, \theta)}{\rho + r-t} \right)^2 dr d\rho \right)^{\frac{1}{2}}.\end{aligned}$$

We make the change of variable $r' - t' = r - t$, $r' + t' = \rho$. We obtain

$$\begin{aligned}& \left(\int_{\frac{t}{2}}^{t+R} \left(\frac{1}{(1+|r-t|)^{1+\mu}} \int_{t+r}^{2T-t+r} \frac{Z^I \tilde{g}_{LL}(\rho, r-t, \theta)}{\rho + r-t} d\rho \right)^2 dr d\theta \right)^{\frac{1}{2}} \\ & \lesssim \left(\int_t^{2T} \frac{1}{\rho^{\frac{5}{4}}} d\rho \right)^{\frac{1}{2}} \left(\int_t^T \int_{t'+\frac{t}{2}}^{R+t'} (r' + t')^{\frac{5}{4}} \left(\frac{1}{(1+|r'-t'|)^{1+\mu}} \frac{Z^I \tilde{g}_{LL}(r' + t', r' - t', \theta)}{r'} \right)^2 dr d\rho \right)^{\frac{1}{2}} \\ & \lesssim \frac{1}{t^{\frac{1}{8}}} \left(\int_t^T \frac{(2t' + R)^{\frac{5}{4}}}{(t' + \frac{t}{2})^3} \left\| \frac{\mathbb{1}_{q \leq R}}{(1+|q|)^{1+\mu}} Z^I \tilde{g}_{LL} \right\|_{L^2}^2 dt' \right)^{\frac{1}{2}}.\end{aligned}$$

In the same way we estimate

$$\begin{aligned}
& \left(\int_{\frac{t}{2}}^{t+R} \left(\frac{1}{(1+|r-t|)^{1+\mu}} \int_{t+r}^{2T-t+r} \frac{Z^I \tilde{g}_{LL}(\rho, r-t, \theta)}{\sqrt{\rho} \sqrt{1+|r-t|}} d\rho \right)^2 dr d\theta \right)^{\frac{1}{2}} \\
& \lesssim \left(\int_t^{2T} \frac{1}{\tau^{1+\frac{1}{2}-4\rho}} d\tau \right)^{\frac{1}{2}} \left(\int_t^T \int_{t'+\frac{t}{2}}^{R+t'} (r'+t')^{1+\frac{1}{2}-4\rho} \left(\frac{1}{(1+|r'-t'|)^{\frac{3}{2}+\mu}} \frac{Z^I \tilde{g}_{LL}(r'+t', r'-t', \theta)}{\sqrt{r'}} \right)^2 dr d\rho \right)^{\frac{1}{2}} \\
& \lesssim \frac{1}{t^{\frac{1}{2}-2\rho}} \left(\int_t^T \frac{(2t'+R)^{1+\frac{1}{2}-4\rho}}{(t'+\frac{t}{2})^{\frac{3}{2}}} \left\| \frac{\mathbb{1}_{q \leq R}}{(1+|q|)^{1+\mu}} Z^I \tilde{g}_{LL} \right\|_{L^2}^2 dt' \right)^{\frac{1}{2}},
\end{aligned}$$

and consequently

$$\begin{aligned}
\left(\int \frac{1}{(1+|q|)^{2+2\mu}} (Z^I \beta)^2 dr d\theta \right)^{\frac{1}{2}} & \lesssim \frac{1}{t^{\frac{1}{8}}} \left(\int_t^T \frac{(2t'+R)^{\frac{5}{4}}}{(t'+\frac{t}{2})^3} \left\| \frac{\mathbb{1}_{q \leq R}}{(1+|q|)^{1+\mu}} Z^I \tilde{g}_{LL} \right\|_{L^2}^2 dt' \right)^{\frac{1}{2}} \\
& \quad + \frac{1}{t^{\frac{1}{2}-2\rho}} \left(\int_t^T \frac{(2t'+R)^{1+\frac{1}{2}-4\rho}}{(t'+\frac{t}{2})^{\frac{3}{2}}} \left\| \frac{\mathbb{1}_{q \leq R}}{(1+|q|)^{1+\mu}} Z^I \tilde{g}_{LL} \right\|_{L^2}^2 dt' \right)^{\frac{1}{2}} \\
& \lesssim \frac{1}{t^{\frac{1}{8}}} \left(\int_t^T \frac{1}{t'^{3-\frac{5}{4}-2\rho}} dt' \right)^{\frac{1}{2}} + \frac{1}{t^{\frac{1}{2}-2\rho}} \left(\int_t^T (1+t)^{-4\rho} \left\| \frac{w'_2(q)}{1+|q|} Z^I g_{LL} \right\|_{L^2}^2 \right)^{\frac{1}{2}} \\
& \lesssim \frac{\varepsilon}{t^{\frac{1}{2}-2\rho}},
\end{aligned} \tag{11.2}$$

where we have used (3.57) (we assume $\mu \geq \frac{1}{2} + \sigma$). It is easy to convince oneself, with Section 9.2 of

$$\int_t^T (1+t)^{-4\rho} \left\| \frac{w'_2(q)}{1+|q|} Z^I g_{LL} \right\|_{L^2}^2 \lesssim \varepsilon.$$

Consequently

$$\left\| \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} |Z^I \beta| \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-2\rho}}.$$

This concludes the proof of Proposition 11.1. \square

Proposition 11.2. *We have the estimates*

$$\begin{aligned}
\|\partial_t Z^{N-1} h(\theta, t)\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \frac{\varepsilon^2}{(1+t)^{2-\frac{1}{2}\sigma}}, \\
\|\partial_t Z^N h(\theta, t)\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}, \\
\int_0^t (1+s) \|\partial_t Z^N h\|_{L^2(\mathbb{S}^1)}^2 & \lesssim \varepsilon^4 (1+t)^{2\rho}, \\
\int_0^t (1+s)^{3-\sigma} \|\partial_t^3 Z^N h\|_{H^{-2}(\mathbb{S}^1)}^2 & \lesssim \varepsilon^4 (1+t)^{2\rho},
\end{aligned}$$

and we can decompose

$$\partial_s h = h_1 + h_2$$

with

$$\begin{aligned}
\|Z^N h_1\|_{H^{-2}(\mathbb{S}^1)} &\lesssim \frac{\varepsilon^2}{(1+t)^{2-\frac{1}{2}\sigma}}, \\
\int_0^t (1+s)^2 \|Z^N h_1\|_{H^{-1}(\mathbb{S}^1)}^2 &\lesssim \varepsilon^2 (1+t)^{2\rho}, \\
\int_0^t (1+s)^4 \|\partial_t Z^N h_1\|_{H^{-2}(\mathbb{S}^1)}^2 &\lesssim \varepsilon^2 (1+t)^{2\rho}, \\
\int_0^t (1+s)^3 \|\partial_t Z^N h_1\|_{H^{-1}(\mathbb{S}^1)}^2 &\lesssim \varepsilon^2 (1+t)^{2\rho}, \\
\|\partial_t Z^N h_2\|_{H^{-2}(\mathbb{S}^1)} &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}-\rho}}, \\
\int_0^t (1+s)^{3-2\rho} \|Z^N h_2\|_{H^{-1}(\mathbb{S}^1)}^2 &\lesssim \varepsilon^2 (1+t)^{2\rho}, \\
\int_0^t (1+s)^3 \|\partial_t Z^N h_1\|_{H^{-1}(\mathbb{S}^1)}^2 &\lesssim \varepsilon^2 (1+t)^{2\rho}.
\end{aligned}$$

Proof. Since ϕ satisfies $\square_g \phi = 0$ we have in coordinates t, r, θ

$$\partial_\mu (g^{\mu\nu} \sqrt{|\det(g)|} \partial_\nu \phi) = 0.$$

We can neglect the contributions of $\Upsilon\left(\frac{r}{t}\right)$, because when it is different from 1, we are far from the

light cone and $q \sim s$. We calculate

$$\begin{aligned}
\partial_t h(\theta, t) &= \int_0^\infty \partial_t \beta g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \phi dr \\
&\quad + \int_0^\infty (1 + \beta) \partial_t \left(g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \right) \partial_r \phi dr + \int_0^\infty (1 + \beta) g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \partial_t \phi dr \\
&= \int_0^\infty \partial_t \beta g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \phi dr \\
&\quad - \int_0^\infty (1 + \beta) \partial_r \left(g^{r\alpha} \sqrt{|\det g|} \partial_\alpha \phi \right) \partial_r \phi dr - \int_0^\infty (1 + \beta) \partial_\theta \left(g^{\theta\alpha} \sqrt{|\det g|} \partial_\alpha \phi \right) \partial_r \phi dr \\
&\quad + \frac{1}{2} \int_0^\infty (1 + \beta) g^{00} \sqrt{|\det g|} \partial_r (\partial_t \phi)^2 \phi dr \\
&\quad + \int_0^\infty (1 + \beta) g^{0r} \sqrt{|\det g|} \partial_r \phi \partial_r \partial_t \phi dr + \int_0^\infty (1 + \beta) g^{0\theta} \sqrt{|\det g|} \partial_\theta \phi \partial_r \partial_t \phi dr \\
&= \int_0^\infty \partial_t \beta g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \phi dr + \int_0^\infty \partial_r \beta g^{rr} \sqrt{|\det g|} (\partial_r \phi)^2 dr \\
&\quad + \frac{1}{2} \int_0^\infty (1 + \beta) g^{rr} \sqrt{|\det g|} \partial_r (\partial_r \phi)^2 dr \\
&\quad - \int_0^\infty (1 + \beta) g^{rt} \sqrt{|\det g|} \partial_r \partial_t \phi \partial_r \phi dr - \int_0^\infty (1 + \beta) \partial_\theta \left(g^{\theta\alpha} \sqrt{|\det g|} \partial_\alpha \phi \right) \partial_r \phi dr \\
&\quad - \int_0^\infty (1 + \beta) \partial_r (g^{rt} \sqrt{|\det g|}) \partial_t \phi \partial_r \phi dr - \int_0^\infty (1 + \beta) \partial_r \left(g^{r\theta} \sqrt{|\det g|} \partial_\theta \phi \right) \partial_r \phi dr \\
&\quad - \frac{1}{2} \int_0^\infty \partial_r \left((1 + \beta) g^{00} \sqrt{|\det g|} \right) (\partial_t \phi)^2 dr \\
&\quad + \int_0^\infty (1 + \beta) g^{0r} \sqrt{|\det g|} \partial_r \phi \partial_r \partial_t \phi dr + \int_0^\infty (1 + \beta) g^{0\theta} \sqrt{|\det g|} \partial_\theta \phi \partial_r \partial_t \phi dr \\
&= \int_0^\infty \partial_t \beta g^{0\alpha} \sqrt{|\det g|} \partial_\alpha \phi \partial_r \phi dr + \frac{1}{2} \int_0^\infty \partial_r \beta \sqrt{|\det g|} (g^{rr} (\partial_r \phi)^2 - g^{00} (\partial_t \phi)^2) dr \\
&\quad - \frac{1}{2} \int_0^\infty (1 + \beta) \left(\partial_r (g^{rr} \sqrt{|\det g|}) (\partial_r \phi)^2 + 2 \partial_r (g^{rt} \sqrt{|\det g|}) \partial_t \phi \partial_r \phi + \partial_r (g^{00} \sqrt{|\det g|}) (\partial_t \phi)^2 \right) dr \\
&\quad - \int_0^\infty (1 + \beta) \partial_\theta \left(g^{\theta\alpha} \sqrt{|\det g|} \partial_\alpha \phi \right) \partial_r \phi dr + \int_0^\infty \partial_r \beta g^{r\theta} \sqrt{|\det g|} \partial_\theta \phi \partial_r \phi dr \\
&\quad + \int_0^\infty (1 + \beta) g^{r\theta} \sqrt{|\det g|} \partial_\theta \phi \partial_r^2 \phi dr + \int_0^\infty (1 + \beta) g^{0\theta} \sqrt{|\det g|} \partial_\theta \phi \partial_r \partial_t \phi
\end{aligned}$$

We analyse the different contribution to $\partial_t h$:

$$\partial_t h = \int A_1 + A_2 + \dots$$

where

$$A_1 = \partial_s \beta \sqrt{|\det(g)|} (\partial_q \phi)^2 \left(-g^{00} + g^{0R} + \frac{1}{2} (g^{RR} - g^{00}) \right) = \partial_s \beta \sqrt{|\det(g)|} (\partial_q \phi)^2 (-4g^{LL} - 4g^{LL}),$$

$$A_2 = \partial_s \beta \sqrt{|\det(g)|} \partial_s \phi \partial_q \phi \left(2g^{0R} + \frac{1}{2} (2g^{RR} + 2g^{00}) \right) = \partial_s \beta \sqrt{|\det(g)|} \partial_s \phi \partial_q \phi 4g^{LL},$$

$$A_3 = \partial_s \beta \sqrt{|\det(g)|} (\partial_s \phi)^2 \left(g^{00} + g^{0R} + \frac{1}{2} (g^{RR} - g^{00}) \right) = \partial_s \beta \sqrt{|\det(g)|} (\partial_s \phi)^2 2g^{LL},$$

$$\begin{aligned}
A_4 &= \partial_q \beta \sqrt{|\det(g)|} (\partial_q \phi)^2 \left(g^{00} - g^{0R} + \frac{1}{2} (g^{RR} - g^{00}) \right) = \partial_q \beta \sqrt{|\det(g)|} (\partial_q \phi)^2 2g^{\underline{LL}}, \\
A_5 &= \partial_q \beta \sqrt{|\det(g)|} \partial_s \phi \partial_q \phi \left(-2g^{0R} + \frac{1}{2} (2g^{RR} + 2g^{00}) \right) = \partial_q \beta \sqrt{|\det(g)|} \partial_s \phi \partial_q \phi 4g^{\underline{LL}}, \\
A_6 &= \partial_q \beta \sqrt{|\det(g)|} (\partial_s \phi)^2 \left(-g^{00} - g^{0R} + \frac{1}{2} (g^{RR} - g^{00}) \right) = \partial_s \beta \sqrt{|\det(g)|} (\partial_s \phi)^2 (-2g^{\underline{LL}} - 4g^{\underline{LL}}), \\
A_7 &= (1 + \beta) (\partial_q \phi)^2 \partial_r \left(\sqrt{|\det g|} (g^{RR} - 2g^{R0} + g^{00}) \right) = (1 + \beta) (\partial_q \phi)^2 \partial_r \left(\sqrt{|\det g|} 4g^{\underline{LL}} \right), \\
A_8 &= (1 + \beta) \partial_q \phi \partial_s \phi \partial_r \left(\sqrt{|\det g|} (g^{RR} - g^{00}) \right) = -(1 + \beta) \partial_s \phi \partial_q \phi \partial_r \left(\sqrt{|\det g|} 4g^{\underline{LL}} \right), \\
A_9 &= (1 + \beta) (\partial_s \phi)^2 \partial_r \left(\sqrt{|\det g|} (g^{RR} + 2g^{R0} + g^{00}) \right) = (1 + \beta) (\partial_s \phi)^2 \partial_r \left(\sqrt{|\det g|} 4g^{\underline{LL}} \right), \\
A_{10} &= (1 + \beta) \partial_\theta \left(g_{UU} \frac{\sqrt{|\det g|}}{r} \partial_U \phi \right) \partial_r \phi, \\
A_{11} &= (1 + \beta) \partial_\theta \left(g_{U\underline{L}} \frac{\sqrt{|\det g|}}{r} \partial_s \phi \right) \partial_r \phi, \\
A_{12} &= (1 + \beta) \partial_\theta \left(g_{UL} \frac{\sqrt{|\det g|}}{r} \partial_q \phi \right) \partial_r \phi, \\
A_{13} &= \partial_s \beta (g^{U0} + g^{UR}) \sqrt{|\det g|} \partial_U \phi \partial_r \phi = \partial_s \beta g^{UL} \sqrt{|\det g|} \partial_U \phi \partial_r \phi, \\
A_{14} &= \partial_q \beta (-g^{U0} + g^{UR}) \sqrt{|\det g|} \partial_U \phi \partial_r \phi = \partial_q \beta g^{U\underline{L}} \sqrt{|\det g|} \partial_U \phi \partial_r \phi, \\
A_{15} &= (1 + \beta) \sqrt{|\det g|} (g^{UR} + g^{U0}) \partial_U \phi \partial_r \partial_s \phi = (1 + \beta) \sqrt{|\det g|} g^{UL} \partial_U \phi \partial_r \partial_s \phi, \\
A_{16} &= (1 + \beta) \sqrt{|\det g|} (g^{UR} - g^{U0}) \partial_U \phi \partial_r \partial_q \phi = (1 + \beta) \sqrt{|\det g|} g^{U\underline{L}} \partial_U \phi \partial_r \partial_q \phi.
\end{aligned}$$

We remark that

$$\sqrt{|\det g|} g^{\underline{LL}} \sim -g_{UU} r.$$

We recall that we choose β such that $\beta = 0$ at time T and

$$2\partial_s \beta + \frac{1}{2} g_{LL} \partial_q \beta = -\frac{\tilde{g}_{LL}}{r} + \partial_s (O(\tilde{g}_{TT})).$$

We remark that thanks to the wave coordinate condition (see Proposition 4.1),

$$\partial_q g_{LL} = \frac{1}{r} \tilde{g}_{LL} + \partial_s O(g_{TT}) + O(\partial_U g_{UL}) + \dots$$

Consequently we have

$$\begin{aligned}
A_1 + A_7 + A_4 &= \partial_s \beta \sqrt{|\det(g)|} (\partial_q \phi)^2 (-4g^{\underline{LL}} - 4g^{\underline{LL}}) + (1 + \beta) (\partial_q \phi)^2 \partial_r \left(\sqrt{|\det g|} 4g^{\underline{LL}} \right) \\
&\quad + \partial_q \beta \sqrt{|\det(g)|} (\partial_q \phi)^2 2g^{\underline{LL}} \\
&= (\partial_q \phi)^2 \sqrt{|\det(g)|} (2\partial_s \beta + \partial_r g_{LL} + \frac{1}{2} g_{LL} \partial_q \beta) + O(r (\partial_q \phi)^2 \partial_r g_{LL} \tilde{g}_1) + s.t. \\
&= O(r (\partial_q \phi)^2 \partial_U g_{UL}) + O(r (\partial_q \phi)^2 \partial_r g_{LL} \tilde{g}_1).
\end{aligned}$$

We note that applying a vector field to h correspond to applying a vector field to the integrand. We note also that we can rid off a ∂_r derivative on a term $Z^N g$ or $\partial Z^N \phi$ by integration by part.

Then we can distribute the vector field and use the L^∞ estimate for the terms $Z^J \tilde{g}$ and $Z^J \phi$ with $J \leq N/2$. We obtain that

$$\partial_s Z^I h = \int B_1 + B_2 + \dots$$

where

$$\begin{aligned} B_1 &= O\left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \partial_s \partial_\theta^\alpha Z^I \phi, \\ B_2 &= O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}}\right) \partial_q \partial_\theta^\alpha Z^I \phi, \\ B_3 &= O\left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \frac{\partial_\theta}{r} \partial_\theta^\alpha Z^I \phi, \\ B_4 &= O\left(\frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}}\right) \partial_\theta^\alpha Z^I g_{\tau\tau}, \\ B_5 &= O\left(\frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}}\right) \partial_\theta^\alpha Z^I \tilde{g}, \\ B_6 &= O\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{7}{2}-8\rho-\sigma}}\right) Z^I \beta, \\ B_7 &= O\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-8\rho}}\right) \partial_\theta^\alpha Z^I \tilde{g}_1, \end{aligned}$$

where $\alpha = 0, 1$. We estimate the term for $I = N$. We start with B_1 . We write

$$\partial_s Z^N \phi = \frac{1}{s} S Z^N \phi + \frac{q}{s} \partial_q Z^N \phi = \frac{1}{s} (S Z^N \phi - s \partial_q \phi Z^N g_{LL}) + \partial_q \phi Z^N g_{LL} + \frac{q}{s} \partial_q Z^N \phi.$$

The last two terms are similar to B_4 and B_2 respectively. We note

$$\tilde{B}_1 = O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) (S Z^N \phi - s \partial_q \phi Z^N g_{LL}).$$

$$\begin{aligned} \left\| \int \tilde{B}_1 \right\|_{H^{-1}(\mathbb{S}^1)} &\lesssim \int \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \|S Z^N \phi - s \partial_q \phi Z^N g_{LL}\|_{L^2(\mathbb{S}^1)} dr \\ &\lesssim \frac{\varepsilon}{(1+t)^2} \left(\int \frac{1}{(1+|q|)^{2+2\rho}} |S Z^N \phi - s \partial_q \phi Z^N g_{LL}|^2 r dr d\theta \right)^{\frac{1}{2}} \left(\int \Upsilon\left(\frac{r}{t}\right) \frac{1}{(1+|q|)^{1-8\rho-2\rho}} \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon}{(1+t)^{2-10\rho}} \|w^{\frac{1}{2}} \partial(S Z^N \phi - s \partial_q \phi Z^N g_{LL})\|_{L^2} \\ &\lesssim \frac{\varepsilon^2}{(1+t)^{2-\frac{1}{2}\sigma}}, \end{aligned}$$

$$\begin{aligned} \left\| \int B_2 \right\|_{H^{-1}(\mathbb{S}^1)} &\lesssim \int \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} \|\partial_q Z^I \phi\|_{L^2(\mathbb{S}^1)} \\ &\lesssim \frac{\varepsilon}{(1+t)^2} \left(\int (\partial_q Z^I \phi)^2 r dr d\theta \right)^{\frac{1}{2}} \left(\int \Upsilon\left(\frac{r}{t}\right) \frac{1}{(1+|q|)^{1-4\rho}} \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon^2}{(1+t)^{2-3\rho}}, \end{aligned}$$

We estimate B_3 in H^{-2} first

$$\left\| \int B_3 \right\|_{H^{-2}(\mathbb{S}^1)} \lesssim \int \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \|Z^N \phi\|_{L^2(\mathbb{S}^1)} dr \lesssim \frac{\varepsilon^2}{(1+t)^{2-5\rho}}.$$

and now in H^{-1}

$$\begin{aligned} \left\| \int B_3 \right\|_{H^{-1}(\mathbb{S}^1)} &\lesssim \int \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \|\bar{\partial} Z^N \phi\|_{L^2(\mathbb{S}^1)} dr \\ &\lesssim \frac{\varepsilon}{(1+t)} \left(\int \frac{1}{(1+|q|)^{1+2\mu}} |\bar{\partial} Z^N \phi|^2 r dr d\theta \right)^{\frac{1}{2}} \left(\int \frac{1}{(1+|q|)^{2-8\rho-2\mu}} \right) \\ &\lesssim \frac{\varepsilon}{1+t} \|w'(q)^{\frac{1}{2}} \bar{\partial} Z^N \phi\|_{L^2} \end{aligned}$$

and so

$$\int_0^t (1+s)^2 \left\| \int B_3 \right\|_{H^{-1}(\mathbb{S}^1)}^2 ds \lesssim \varepsilon^4 (1+t)^{2\rho}.$$

We also have

$$\left\| \int B_3 \right\|_{H^{-1}(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{1-\rho}}.$$

We now turn to B_4 .

$$\begin{aligned} \left\| \int B_4 \right\|_{H^{-1}(\mathbb{S}^1)} &\lesssim \int \frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} \|Z^N g_{L\mathcal{T}}\|_{L^2(\mathbb{S}^1)} \\ &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} \left(\int \frac{1}{(1+|q|)^{2-2\sigma-16\rho}} \right) \left\| \frac{w_2(q)}{(1+|q|)^{\frac{3}{2}}} Z^N \tilde{g}_{L\mathcal{T}} \right\|_{L^2}^2. \end{aligned}$$

First of all, thanks to (3.57) we have

$$\left\| \int B_4 \right\|_{H^{-1}(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-\varepsilon}}.$$

We estimate this thanks to Propositions 4.5, 4.10 and 4.14. We have to decompose $B_4 = B_4^{(1)} + B_4^{(2)}$ with

$$\int_0^t (1+t)^{3-2\rho} \left\| \int B_4^{(1)} \right\|_{H^{-1}(\mathbb{S}^1)} \lesssim \varepsilon^2 (1+t)^{2\rho},$$

and

$$B_4^{(2)} = O \left(\frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} \partial_\theta^\alpha (\sigma_{UL}^0) (1 - \chi(q)) \right) = O \left(\frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} (1 - \chi(q)) s \partial_s Z^N b \right).$$

We again decompose $B_4^{(2)} = \tilde{B}_4^{(2)} + \tilde{B}_4^{(3)}$ with

$$\tilde{B}_4^{(2)} = O \left(\frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} (1 - \chi(q)) s Z^N f_1 \right)$$

and

$$\tilde{B}_4^{(3)} = O \left(\frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} (1 - \chi(q)) s Z^N f_2 \right).$$

We have

$$\left\| \int \tilde{B}_4^{(2)} \right\|_{L^2(\mathbb{S}^1)} \lesssim \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} \|Z^N f_1\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^4}{(1+s)^{2-\frac{1}{4}}}$$

and

$$\int_0^t (1+s)^{3-2\rho} \left\| \int \tilde{B}_4^{(3)} \right\|_{L^2(\mathbb{S}^1)}^2 \lesssim \varepsilon^4 \int_0^t (1+s)^{3-2\rho} \|Z^N f_2\|_{L^2}^2 \lesssim \varepsilon^6 (1+t)^{2\rho}.$$

$$\begin{aligned} \left\| \int B_5 \right\|_{H^{-1}(\mathbb{S}^1)} &\lesssim \int \frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}} \|Z^I \tilde{g}\|_{L^2(\mathbb{S}^1)} \\ &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{5}{2}}} \left\| \frac{1}{(1+|q|)^{1+\mu+\sigma}} \partial Z^I \tilde{g} \right\|_{L^2} \left(\int \frac{1}{(1+|q|)^{2-16\rho-\mu}} \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon^2}{(1+s)^{\frac{5}{2}}} \|w_1^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{5}{2}-2\rho}}. \end{aligned}$$

To estimate B_6 we use (11.2).

$$\begin{aligned} \left\| \int B_6 \right\|_{L^2} &\lesssim \int \left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{7}{2}-8\rho-\sigma}} \right) Z^I \beta \\ &\lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}}} \left(\int \frac{1}{2+2\mu} |Z^I \beta|^2 dr \right)^{\frac{1}{2}} \\ &\lesssim \frac{\varepsilon^3}{(1+t)^{2-2\rho}}. \end{aligned}$$

We estimate

$$\begin{aligned} \left\| \int B_7 \right\|_{H^{-1}(\mathbb{S}^1)} &\lesssim \int \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-8\rho}} \|Z^N \tilde{g}_1\|_{L^2(\mathbb{S}^1)} \\ &\lesssim \frac{\varepsilon^2}{(1+s)^2} \left(\int \frac{1}{(1+|q|)^{1-2\sigma-8\rho}} \right) \left\| \frac{w_2(q)^{\frac{1}{2}}}{1+|q|} Z^N \tilde{g}_1 \right\|_{L^2}^2 \\ &\lesssim \frac{\varepsilon^2}{(1+s)^{2-\frac{1}{4}}}. \end{aligned}$$

We set

$$h_1 = \int \tilde{B}_1 + B_2 + B_3 + \tilde{B}_4^{(2)} + B_5 + B_6 + B_7, \quad h_2 = \int B_4^{(1)} + \tilde{B}_4^{(3)}.$$

We now turn to the estimate of $\partial_s^2 Z^N h$. We start with $\partial_s h_1$. We have

$$\begin{aligned} \partial_s \tilde{B}_1 &= O \left(\frac{\varepsilon}{(1+s)^{\frac{5}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \right) (SZ^N \phi - s \partial_q \phi Z^N g_{LL}) \\ &\quad + O \left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \right) \partial_s (SZ^N \phi - s \partial_q \phi Z^N g_{LL}). \end{aligned}$$

We estimate

$$\begin{aligned}
& \left\| \int \partial_s \tilde{B}_1 \right\|_{H^{-1}(\mathbb{S}^1)} \\
& \lesssim \int \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \|\partial_s(SZ^N \phi - s\partial_q \phi Z^N g_{LL})\phi\|_{L^2(\mathbb{S}^1)} dr + \frac{\varepsilon^2}{(1+t)^{3-5\rho-\mu}} \\
& \lesssim \frac{\varepsilon}{(1+t)^2} \left(\int \frac{1}{(1+|q|)^{1+2\mu}} |\partial_s(SZ^N \phi - s\partial_q \phi Z^N g_{LL})|^2 r dr d\theta \right)^{\frac{1}{2}} \left(\int \Upsilon\left(\frac{r}{t}\right) \frac{1}{(1+|q|)^{2-8\rho-2\mu}} \right)^{\frac{1}{2}} \\
& \lesssim \frac{\varepsilon}{(1+t)^2} \|w'(q)\partial_s(SZ^N \phi - s\partial_q \phi Z^N g_{LL})\|_{L^2}.
\end{aligned}$$

To estimate $\partial_s \int B_2$ and $\partial_s \int B_3$ we note that

$$\partial_s \int B_2 dr = \int \frac{1}{t} S B_2 + \frac{r}{t} \partial_r B_2 = \frac{1}{t} \int S B_2 - B_2.$$

Consequently we obtain

$$\begin{aligned}
\left\| \partial_s \int B_2 \right\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \frac{\varepsilon^2}{(1+t)^{3-3\rho}}, \\
\left\| \partial_s \int B_3 \right\|_{H^{-2}(\mathbb{S}^1)} & \lesssim \frac{\varepsilon^2}{(1+t)^{3-5\rho}}, \\
\left\| \partial_s \int B_3 \right\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \frac{\varepsilon}{(1+t)^{\frac{3}{2}}} \|w'(q)^{\frac{1}{2}} \bar{\partial} S Z^N \phi\|_{L^2}, \\
\left\| \int \partial_s \tilde{B}_4^{(2)} \right\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \int \frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} \|s Z^N \partial_s f_1\|_{L^2(\mathbb{S}^1)}, \\
\left\| \int \partial_s B_5 \right\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \int \frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}} \|\partial_s Z^I \tilde{g}\|_{L^2(\mathbb{S}^1)} \\
& \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{5}{2}}} \|w'_1(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}\|_{L^2}.
\end{aligned}$$

Since $\partial_s \beta \sim \frac{\tilde{g}_{LL}}{r} + \bar{\partial} \tilde{g}_{L\mathcal{T}}$, $\partial_s B_6$ gives contributions similar to $\partial_s B_7$.

$$\begin{aligned}
\left\| \int \partial_s B_7 \right\|_{H^{-1}(\mathbb{S}^1)} & \lesssim \int \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-8\rho}} \|\partial_s Z^N \tilde{g}_1\|_{L^2(\mathbb{S}^1)} \\
& \lesssim \frac{\varepsilon^2}{(1+s)^2} \left(\int \frac{1}{(1+|q|)^{1-2\sigma-8\rho}} \right) \left\| w'_2(q)^{\frac{1}{2}} \partial_s Z^N \tilde{g}_1 \right\|_{L^2}^2.
\end{aligned}$$

Consequently we have proven

$$\begin{aligned}
& \int_0^t (1+s)^4 \|\partial_s h_1\|_{H^{-2}(\mathbb{S}^1)}^2 ds \\
& \lesssim \int_0^t \varepsilon^2 \left\| w'(q)^{\frac{1}{2}} \bar{\partial} S Z^N \phi \right\|_{L^2}^2 + \frac{\varepsilon^2}{(1+s)} \left\| w'_1(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 + \varepsilon^2 \left\| w'_2(q)^{\frac{1}{2}} \partial_s Z^N \tilde{g}_1 \right\|_{L^2}^2 + \frac{\varepsilon^4}{(1+s)^{2-\frac{1}{4}}} ds \\
& \lesssim \varepsilon^4 (1+t)^{2\rho},
\end{aligned}$$

and also

$$\int_0^t (1+s)^3 \|\partial_s h_1\|_{H^{-1}(\mathbb{S}^1)}^2 ds \lesssim \varepsilon^4 (1+t)^{2\rho}.$$

We now turn to h_2 . We have

$$\begin{aligned} & \left\| \int \partial_s (B_4^{(2)} + \tilde{B}_4^{(3)}) \right\|_{H^{-1}(\mathbb{S}^1)} \\ & \lesssim \int \frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} \|\partial_s Z^N g_{\mathcal{T}\mathcal{T}}\|_{L^2(\mathbb{S}^1)} + \int \frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} \|s \partial_s Z^N b\|_{L^2(\mathbb{S}^1)} \\ & \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} \left\| w'_2(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_{\mathcal{T}\mathcal{T}} \right\|_{L^2} + \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} \|\partial_s Z^N b\|_{L^2(\mathbb{S}^1)} \end{aligned}$$

and consequently

$$\int_0^t (1+s)^3 \|\partial_s h_2\|_{H^{-1}(\mathbb{S}^1)}^2 ds \lesssim \int_0^t \left\| w'_2(q)^{\frac{1}{2}} \bar{\partial} Z^N \tilde{g}_{\mathcal{T}\mathcal{T}} \right\|_{L^2}^2 + \int_0^t (1+s)^3 \|\partial_s Z^N b\|_{L^2(\mathbb{S}^1)}^2 ds \lesssim \varepsilon^4 (1+t)^{2\rho}.$$

We now do the estimate of $\partial_s h$ in L^2 . We can write the terms of our decomposition in the form

$$\begin{aligned} \tilde{B}_1 &= O\left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \bar{\partial} S Z^N \phi, \\ B_2 &= O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}}\right) \partial Z^{N+1} \phi, \\ B_3 &= O\left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \bar{\partial} Z^{N+1} \phi, \\ B_4 + B_7 &= O\left(\frac{\varepsilon^2}{(1+|q|)^{3-8\rho}}\right) \bar{\partial} Z^N \tilde{g}_1, \\ B_5 &= O\left(\frac{\varepsilon^2}{(1+|q|)^{2-8\rho}(1+s)}\right) \bar{\partial} Z^N \tilde{g}, \\ B_6 &= O\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{7}{2}-8\rho-\sigma}}\right) Z^N \beta. \end{aligned}$$

We estimate

$$\begin{aligned} & \left\| \int \tilde{B}_1 \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon}{1+t} \|w'(q) \bar{\partial} S Z^N \phi\|_{L^2}, \\ & \left\| \int B_2 \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon}{(1+t)^2} \left(\int \Upsilon\left(\frac{r}{t}\right) \frac{1}{(1+|q|)^{1-8\rho}} \right)^{\frac{1}{2}} \|w(q) \bar{\partial} \partial Z^{N+1} \phi\|_{L^2} \lesssim \frac{\varepsilon^2}{(1+t)^{\frac{3}{2}-4\rho}}, \\ & \left\| \int B_3 \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon}{1+t} \|w'(q)^{\frac{1}{2}} \bar{\partial} Z^{N+1} \phi\|_{L^2} \\ & \left\| \int B_4 + B_7 \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{1}{2}}} \|w'_2(q) \bar{\partial} Z^N \tilde{g}_1\|_{L^2}^2, \\ & \left\| \int B_5 \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}} \|w'_1(q) \bar{\partial} Z^N \tilde{g}\|_{L^2}^2, \end{aligned}$$

$$\left\| \int B_6 \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+t)^{2-\rho}}.$$

Consequently

$$\begin{aligned} \int_0^t (1+s) \|\partial_s h\|_{L^2}^2 ds &\lesssim \varepsilon \int_0^t \frac{1}{1+s} \left\| w'(q)^{\frac{1}{2}} \bar{\partial} Z^{N+1} \phi \right\|_{L^2}^2 + \frac{\varepsilon}{(1+s)^{2-8\rho}} ds \\ &\quad + \int_0^t \left\| w'_2(q) \bar{\partial} Z^N \tilde{g}_1 \right\|_{L^2}^2 + \frac{1}{(1+s)^2} \left\| w'_1(q) \bar{\partial} Z^N \tilde{g} \right\|_{L^2}^2 ds \\ &\lesssim \varepsilon^2 (1+t)^{2\rho}. \end{aligned}$$

We finish with the estimate of $\partial_s^3 h(\theta, s)$ in $H^{-2}(\mathbb{S}^1)$. We claim that it satisfies the same estimate than $\partial_s h(\theta, s)$. Indeed, to estimate

$$\partial_t^2 B_1 = \int O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \partial_t^2 S Z^I \phi,$$

we write

$$g_0 \partial_t^2 S Z^I \phi = g_{00} \partial_2^t S Z^I \phi - \square_g Z^I \phi + \square_g S Z^I \phi = O(\partial_r \partial S Z^I \phi) + O(\partial_U \partial S Z^I \phi).$$

The term $\square_g S Z^I \phi$ contains quadratic term and we can neglect it. We can get rid of a ∂_r with an integration by part, and we are reduced to estimate

$$\int O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \partial S Z^I \phi,$$

which can be estimated in the same way than \tilde{B}_1 . We can treat the other term in a similar way. This concludes the proof of Proposition 11.2. \square

Proposition 11.3. *We have*

$$\|\partial_t Z^{N-11} h\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{(1+s)^2}.$$

Proof. We use the decomposition $\partial_s h = \int B_1 + B_2 + \dots$. We estimate,

$$B_1 = O\left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) \partial_s \partial_\theta^\alpha Z^I \phi = O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{3}{2}-4\rho}}\right) Z^{I+2} \phi,$$

so thanks to (3.1)

$$B_1 = O\left(\frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}}\right).$$

In the same way

$$B_2 = O\left(\frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}}\right) \partial_q \partial_\theta^\alpha Z^I \phi = O\left(\frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}}\right),$$

$$B_3 = O\left(\frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{1}{2}-4\rho}}\right) \frac{\partial_\theta}{r} \partial_\theta^\alpha Z^I \phi = O\left(\frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}}\right).$$

We estimate

$$B_4 = O\left(\frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}}\right) \partial_\theta^\alpha Z^I g_{\mathcal{T}\mathcal{T}}.$$

Thanks to estimates (4.12), (4.60) and (4.27) we can estimate

$$\partial_\theta Z^I g_{\mathcal{T}\mathcal{T}} = O\left(\frac{\varepsilon(1+|q|)^{\frac{1}{2}-\rho}}{(1+s)}\right) + O(s\partial_s Z^I b).$$

Consequently

$$B_4 = O\left(\frac{\varepsilon^3}{(1+s)^2(1+|q|)^{\frac{5}{2}-9\rho}}\right) + O\left(\frac{\varepsilon^2}{(1+|q|)^{3-8\rho}}\partial_s Z^I b\right) = O\left(\frac{\varepsilon^3}{(1+s)^2(1+|q|)^{\frac{5}{2}-9\rho}}\right).$$

where we have used the estimate (2.2) for $\partial_s Z^I b$. We estimate

$$B_5 = O\left(\frac{\varepsilon^2}{(1+s)^2(1+|q|)^{2-8\rho}}\right)\partial_\theta^\alpha Z^I \tilde{g} = O\left(\frac{\varepsilon^2}{(1+s)^{\frac{5}{2}-\rho}(1+|q|)^{2-8\rho}}\right),$$

$$B_6 = O\left(\frac{\varepsilon^2}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{7}{2}-8\rho-\sigma}}\right)Z^I \beta.$$

The equation (11.1) gives, for $I \leq N-6$

$$Z^I \beta(q, s, \theta) = O\left(\frac{(1+|q|)^{\frac{1}{2}+\sigma}}{(1+s)^{\frac{3}{2}}}\right) + \int_s^{2T-q} \frac{\varepsilon(1+|q|)^{\frac{1}{2}+\sigma}}{(\tau+q)(1+\tau)^{\frac{1}{2}}} d\tau = O\left(\frac{\varepsilon(1+|q|)^{\frac{1}{2}+\sigma}}{(1+s)^{\frac{1}{2}}}\right).$$

where we have used (3.51). Consequently we obtain

$$B_6 = O\left(\frac{\varepsilon^2}{(1+s)^2(1+|q|)^{3-8\rho-\sigma}}\right).$$

By integrating we obtain

$$Z^I h = O\left(\frac{\varepsilon^2}{(1+s)^2}\right).$$

□

Proposition 11.4. *We have*

$$\left\| Z^{N-1} \left(h + 2 \int \partial_r \phi(t, r, \theta) \partial_t \phi(t, r, \theta) r dr \right) \right\|_{L^2} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-\rho}},$$

$$\left\| Z^{N-5} \left(h + 2 \int \partial_r \phi(t, r, \theta) \partial_t \phi(t, r, \theta) r dr \right) \right\|_{L^2} \lesssim \frac{\varepsilon^3}{\sqrt{1+t}}.$$

Proof. We have

$$h - \int (\partial_q \phi)^2 r dr = \int O(\bar{\partial} \phi \partial \phi) r + O(\beta(\partial \phi)^2) r + O(\tilde{g}_1(\partial \phi)^2) r = \int C$$

with

$$C \lesssim \frac{\varepsilon^2}{(1+|q|)^{\frac{3}{2}-4\rho-\sigma}} |\partial Z^I \phi| + \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} (|Z^I \tilde{g}_1| + |Z^I \beta|).$$

We have already estimated, for $I \leq N-1$ (see the proof of Proposition 3.5)

$$\left\| \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} (|Z^I \tilde{g}_1| + |Z^I \beta|) \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-\rho}}.$$

We have

$$\left\| \int \frac{\varepsilon^2}{(1+|q|)^{\frac{3}{2}-4\rho-\sigma}} |\partial Z^I \phi| \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^2}{\sqrt{1+t}} \|\partial Z^I \phi\|_{L^2} \left(\int \frac{1}{(1+|q|)^{2-8\rho-2\sigma}} \right)^{\frac{1}{2}} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-\rho}}.$$

For $I \leq N-5$ we easily see from the previous calculation

$$\begin{aligned} \left\| \int \frac{\varepsilon^2}{(1+|q|)^{\frac{3}{2}-4\rho-\sigma}} |\partial Z^I \phi| \right\|_{L^2(\mathbb{S}^1)} &\lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}}}, \\ \left\| \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} |Z^I \tilde{g}_1| \right\|_{L^2(\mathbb{S}^1)} &\lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}}}, \end{aligned}$$

where we use (3.61). Thanks to (11.2) we have

$$\begin{aligned} \left(\int \frac{1}{(1+|q|)^{2+2\mu}} (Z^{N-5} \beta)^2 dr d\theta \right)^{\frac{1}{2}} &\lesssim \frac{1}{t^{\frac{1}{8}}} \left(\int_t^T \frac{(2t' + R)^{\frac{5}{4}}}{(t' + \frac{t}{2})^3} \left\| \frac{\mathbb{1}_{q \leq R}}{(1+|q|)^{1+\mu}} Z^{N-5} \tilde{g}_{LL} \right\|_{L^2}^2 dt' \right)^{\frac{1}{2}} \\ &\lesssim \frac{1}{t^{\frac{1}{8}}} \left(\int_t^T \frac{1}{t'^{3-\frac{5}{4}}} dt' \right)^{\frac{1}{2}} \leq \frac{\varepsilon}{t^{\frac{1}{2}}}, \end{aligned}$$

and consequently

$$\left\| \int \frac{\varepsilon^2}{(1+|q|)^{3-8\rho}} |Z^{N-5} \beta| \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-\rho}}.$$

□

We now prove Proposition 3.5.

Proof. We extend h to ∞ by setting

$$h'(\theta, s) = \psi(s)h(\theta, s) + (1 - \psi(s))h(\theta, 2T),$$

where ψ is a cut-off function such that $\psi = 1$ for $s \leq 2T-1$ and $\psi = 0$ for $s > 2T$. The fact that h' satisfy the estimates of Proposition 11.1 is straightforward. For the estimates of Propositions 11.2 and 11.3 we just have to notice that

$$\partial_s h'(\theta, s) = \psi(s) \partial_s h(\theta, s) + \psi'(s)(h(\theta, s) - h(\theta, 2T)).$$

Since in the region $s \sim 2T$, we have $h(\theta, s) - h(\theta, 2T) = O(\partial_s h)$, we easily see that $\partial_s h'$ satisfy the same estimates as $\partial_s h$. For the estimates (3.41) and (3.42) we write

$$h'(\theta, s) = h(\theta, s) + (1 - \psi(s))(h(\theta, 2T) - h(\theta, s)),$$

and notice that

$$\|Z^{N-1}(h(\theta, 2T) - h(\theta, s))\|_{L^2(\mathbb{S}^1)} \lesssim \int_s^{2T} \|Z^N(\partial_s h)\|_{H^{-1}(\mathbb{S}^1)} \frac{\varepsilon^2}{(1+s)^{1-\rho}} \lesssim \frac{\varepsilon^2}{\sqrt{T}(1+s)^{\frac{1}{2}-\rho}}.$$

Without loss of generality, we can assume $T \geq \frac{C}{\varepsilon^2}$, and consequently

$$\|Z^{N-1}(h(\theta, 2T) - h(\theta, s))\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+s)^{\frac{1}{2}-\rho}}.$$

In a similar way

$$\|Z^{N-5}(h(\theta, 2T) - h(\theta, s))\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+s)^{\frac{1}{2}}},$$

which concludes the proof of Proposition 3.5. □

11.2 Proof of Proposition 3.6

We want to find three coefficients $b_0(s), b_1(s), b_2(s)$ and a solution $b(\theta, s)$ of

$$\begin{aligned} & 2b_0(1+f) + 1 - (1+b)^2 - 2(1+b)\partial_\theta \left(\frac{\partial_\theta b}{(1+b)^2} \right) - (1+b)(\partial_\theta b)^2 - 2(1+b)^{-2}(\partial_\theta b)^2 \\ & = \Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta) \end{aligned}$$

satisfying $\int \frac{b}{1+b} d\theta = 0$ and $1 + \partial_\theta f = (1+b)^{-1}$. We make a change of unknown $\beta = \frac{b}{1+b}$. We calculate

$$\partial_\theta^2 \beta = \frac{\partial_\theta^2 b}{(1+b)^2} - 2 \frac{(\partial_\theta b)^2}{(1+b)^3}.$$

The problem is therefore equivalent to find $b_0(s), b_1(s), b_2(s)$ and β solution of

$$-2\partial^2 \beta - \beta = (1+\beta)(\Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2) \quad (11.3)$$

with $\int \beta = 0$ and f defined by $\partial_\theta f = -\beta$, and we have denoted by R a quadratic form. We will do this with a fixed point argument. We consider $F : H^2(\mathbb{S}^1) \mapsto H^2(\mathbb{S}^1)$ which maps β such that $\|\beta\|_{H^2} \leq \varepsilon$ and $\int \beta = 0$ to β'' solution of

$$-2\partial^2 \beta' - 2\beta' = (1+\beta)(\Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2) \quad (11.4)$$

with b_1, b_2, b_0 chosen such that

$$\int \cos(\theta) ((1+\beta)(\Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2)) d\theta = 0, \quad (11.5)$$

$$\int \sin(\theta) ((1+\beta)(\Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2)) d\theta = 0, \quad (11.6)$$

$$\int ((1+\beta)(\Pi h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2)) d\theta = 0. \quad (11.7)$$

We first show that we can find three such coefficients. We have, thanks to Sobolev embedding

$$|b| + |\partial_\theta b| \leq \varepsilon.$$

Consequently the three integral conditions (11.5), (11.6) and (11.7) can be written

$$\frac{1}{2}b_1 = O(\varepsilon)b_0 + O(\varepsilon)b_1 + O(\varepsilon)b_2 + \int \cos(\theta) ((1+\beta)(\Pi h'(\theta, s) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2)) d\theta.$$

$$\frac{1}{2}b_2 = O(\varepsilon)b_0 + O(\varepsilon)b_1 + O(\varepsilon)b_2 + \int \sin(\theta) ((1+\beta)(\Pi h'(\theta, s) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2)) d\theta.$$

$$b_0 = \int ((1+\beta)(\Pi h'(\theta, s) - 2a_0(1+f)) + R((\partial_\theta \beta)^2, \beta^2)) d\theta.$$

This system is invertible : we have a unique solution which satisfy the estimate

$$|b_0| + |b_1| + |b_2| \lesssim \|h'\|_{L^2(\mathbb{S}^1)} + \varepsilon \|\beta\|_{H^1(\mathbb{S}^1)} \lesssim \varepsilon^2.$$

Thanks to (11.5) and (11.6), we are allowed to solve (11.4). There exists a unique solution $\beta' \in H^2(\mathbb{S}^1)$, and it satisfies

$$\|\beta'\|_{H^2} \lesssim \|h'\|_{L^2(\mathbb{S}^1)} + \varepsilon \|\beta\|_{H^1(\mathbb{S}^1)} + |a_0| \lesssim \varepsilon^2$$

Moreover, thanks to (11.7) we have $\int \beta' = 0$. We see easily that the map F is contracting. Consequently it admits a unique fixed point $\beta(\theta, s)$, satisfying

$$\|\beta\|_{H^2} \lesssim \|h'\|_{L^{(2)}} + |a_0|.$$

Moreover there exists b_0, b_1, b_2 such that β satisfy (11.3). In addition we have

$$\|\beta\|_{H^{k+2}} \lesssim \|h'\|_{H^k} + |a_0|,$$

and deriving (11.3), (11.5), (11.6) and (11.7) with respect to s we obtain

$$\begin{aligned} \|\partial_s^l \beta\|_{H^{k+2}} &\lesssim \|\partial_s^l h'\|_{H^k}, \\ |\partial_s^l b_0| + |\partial_s^l b_1| + |\partial_s^l b_2| &\lesssim \|\partial_s^l h'\|_{L^2}. \end{aligned}$$

11.3 Proof of Proposition 3.7

From the initial data of Theorem 1.3, we can construct a solution of (1.1) up to time $T = 1$. Moreover, this solution exists in the entire region $q > R + 1$, $t > 0$ (see Appendix A). Let be $b^{(2)}$ defined by Proposition 3.6 and set

$$h^{(2)} h'(\theta, s) + b_0 + b_1 \cos(\theta) + b_2 \sin(\theta).$$

By performing the change of variable of Section 2.1 with $b^{(2)}$, and looking at the data on $t = 0$, we obtain solution of the constraint equation with the desired asymptotic behaviour (see Appendix B)

$$g^{(2)} = g_{b^{(2)}} + \tilde{g}^{(2)}.$$

We consider the solution $(g^{(2)}, \phi^{(2)})$ in generalized wave coordinates

$$(H^{(2)})^\alpha = (g^{(2)})^{\lambda\beta} (\Gamma^{(2)})_{\lambda\beta}^\alpha = (F^{(2)})^\alpha + (G^{(2)})^\alpha + (\tilde{G}^{(2)})^\alpha,$$

with

$$(F^{(2)})^\alpha = \square_{g_{b^{(2)}}} x^\alpha.$$

$$\begin{aligned} U_\alpha (G^{(2)})^\alpha &= -(\sigma_{U\underline{L}}^0)^{(2)} \chi'(q), \\ L_\alpha (g^{(2)})^\alpha &= \frac{1}{r} \Upsilon \left(\frac{r}{r} \right) \int_{-\infty}^r \left(2(\partial_q \phi^{(2)})^2 r - h^{(2)}(\theta, 2t) \chi'(q) \right) dr, \\ \underline{L}_\alpha (G^{(2)})^\alpha &= 0, \end{aligned}$$

where $(\sigma_{U\underline{L}}^0)^{(2)} = s(1 + b^{(2)}) \partial_s f^{(2)}$ with

$$1 + \partial_\theta f^{(2)} = (1 + b^{(2)})^{-1},$$

and $(\tilde{G}^{(2)})^\alpha$ contains the terms of the form $\tilde{g}^{(2)} \partial_s^l \partial_\theta^k b^{(2)}$, where $l + k - 2 \geq 1$ or $l \geq 2$. $b^{(2)}$ satisfy the hypothesis (2.2) to (2.14). We assume that on $[0, T^{(2)}]$, $g^{(2)}$ satisfy the bootstrap estimates. Thanks to all we have done so far, we know that $(g^{(2)}, \phi^{(2)})$ satisfies the improved bootstrap estimates, except (3.26) which remained to be proved. For this, thanks to Proposition 11.4, all we have to do is comparing ϕ and $\phi^{(2)}$. We can pass from (g, ϕ) to $(g^{(2)}, \phi^{(2)})$ by a change of variable, that we note Ψ .

We note $x^{(2)} = \Psi(x)$ the new generalized wave coordinates. We have

$$|\nabla s^{(2)}|_g = \left| (g^{(2)})^{LL} \right|,$$

and so

$$\begin{aligned}
|s^{(2)} - s| &\lesssim \int_s^q |g_{b^{(2)}}^{LL} - g_b^{LL}| + |\tilde{g}^{(2)}| dq \\
&\lesssim \int_s^q O\left(\frac{q}{s} \partial_\theta(b - b^{(2)})\right) + \frac{\varepsilon}{(1 + |q|)^{\frac{1}{2} + \delta} (1 + s)^{\frac{1}{2} - \rho}} \\
&\lesssim \varepsilon \sqrt{1 + s}.
\end{aligned}$$

where we have used that $\delta - \rho \geq \frac{1}{2}$. and in the interior

$$\begin{aligned}
|s^{(2)} - s| &\lesssim \int_s^q |\tilde{g}^{(2)}| dq + |s^{(2)} - s|_{q=0} \\
&\lesssim \varepsilon \sqrt{1 + s} + \int_s^q \frac{\varepsilon}{(1 + s)^{\frac{1}{2} - \rho}} \\
&\lesssim \varepsilon \sqrt{1 + s} + \varepsilon \frac{1 + |q|}{(1 + s)^{\frac{1}{2} - \rho}}.
\end{aligned}$$

We have in the exterior region

$$|\nabla(q^{(2)} - q(1 + b^{(2)})^{-1})|_g = |(\tilde{g}^{(2)})^{\underline{LL}}|,$$

so in the exterior region we obtain

$$\begin{aligned}
|q^{(2)} - q| &\lesssim |q|(b^{(2)} - b) + \int_s^q |(\tilde{g}^{(2)})^{\underline{LL}}| dq \\
&\lesssim |q|(b^{(2)} - b) + \int_s^q \frac{\varepsilon}{(1 + |q|)^{-\frac{1}{2} + \delta - \sigma} (1 + s)^{\frac{3}{2} - \rho}} dq \\
&\lesssim \frac{\varepsilon |q|}{\sqrt{1 + s}} + \frac{\varepsilon}{(1 + s)^{\delta - \sigma - \rho}}
\end{aligned}$$

We recall that $\delta - \sigma - \rho \geq \frac{1}{2}$. In the interior we obtain

$$\begin{aligned}
|q^{(2)} - q| &\lesssim \int_s^q |(\tilde{g}^{(2)})^{\underline{LL}}| dq + |q^{(2)} - q|_{q=0} \\
&\lesssim \frac{\varepsilon}{\sqrt{1 + s}} + \int_s^q \frac{\varepsilon(1 + |q|)^{\frac{3}{2} + \sigma}}{(1 + s)^{\frac{3}{2}}} \\
&\lesssim \frac{\varepsilon(1 + |q|)^{\frac{3}{2} + \sigma}}{(1 + s)^{\frac{1}{2}}}.
\end{aligned}$$

We have

$$|\nabla \theta^{(2)}|_g = \frac{1}{r} |(g^{(2)})^{UU}|,$$

so in the exterior

$$\begin{aligned}
|\theta^{(2)} - \theta| &\lesssim \int_s^q \frac{1}{r} |g_{b^{(2)}}^{LL} - g_b^{LL}| + \frac{1}{r} |\tilde{g}^{(2)}| dq \\
&\lesssim \int_s^q O\left(\frac{q}{s^2} \partial_\theta(b - b^{(2)})\right) + \frac{\varepsilon}{(1 + |q|)^{\frac{1}{2} + \delta} (1 + s)^{\frac{3}{2} - \rho}} \\
&\lesssim \frac{\varepsilon}{\sqrt{1 + s}},
\end{aligned}$$

and in the interior

$$\begin{aligned}
|\theta^{(2)} - \theta| &\lesssim \int_s^q \frac{1}{r} |\tilde{g}^{(2)}| dq + |\theta^{(2)} - \theta|_{q=0} \\
&\lesssim \frac{\varepsilon}{\sqrt{1+s}} + \int_s^q \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} \\
&\lesssim \frac{\varepsilon}{\sqrt{1+s}} + \varepsilon \frac{1+|q|}{(1+s)^{\frac{3}{2}-\rho}}.
\end{aligned}$$

With these estimates it is easy to see that $\phi^{(2)}$ satisfy the same improved estimates as ϕ . We have
We have

$$\phi^{(2)}(x) = \phi(\Psi(x)).$$

We calculate

$$\partial\phi^{(2)} = (\partial s^{(2)})\partial_s\phi(\Psi(x)) + (\partial q^{(2)})\partial_q\phi(\Psi(x)) + (\partial q^{(2)})\partial_q\phi(\Psi(x)).$$

We compare ϕ and $\phi^{(2)}$ to improve (3.26). ϕ is non zero only in the interior region. We obtain

$$\begin{aligned}
|\partial\phi^{(2)} - (\partial\phi)(\Psi(x))| &\lesssim |\tilde{g}||\bar{\partial}\phi| + |\tilde{g}_{LL}||\partial_q\phi| \\
&\lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}} \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} + \frac{1+|q|}{(1+s)^{\frac{3}{2}-\rho}} \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}-4\rho}} \\
&\lesssim \frac{\varepsilon^2}{(1+|q|)^{\frac{1}{2}-5\rho}(1+s)^{2-\rho}}.
\end{aligned}$$

We estimate

$$\begin{aligned}
|(\partial\phi)(\Psi(x)) - \partial\phi(x)| &\lesssim \left| \int_0^1 (x^{(2)} - x) \cdot \nabla \partial\phi(x + \tau(x^{(2)} - x)) d\tau \right| \\
&\lesssim \int_0^1 \varepsilon(1+s)^{\frac{1}{2}} |\bar{\partial}\partial\phi(x + \tau(x^{(2)} - x))| + \frac{\varepsilon(1+|q|)^{\frac{3}{2}+\sigma}}{(1+s)^{\frac{1}{2}}} |\partial^2\phi(x + \tau(x^{(2)} - x))| d\tau \\
&\lesssim \frac{\varepsilon^2}{(1+s)(1+|q|)^{1-4\rho-\sigma}}
\end{aligned}$$

In the same way we have

$$|\partial Z^I \phi^{(2)} - (\partial Z^I \phi)(\Psi(x))| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}} |Z^{I+1}\phi| + \frac{\varepsilon}{\sqrt{1+s}(1+|q|)^{\frac{3}{2}-4\rho}} |Z^I g_{LL}| + \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{\frac{1}{2}-4\rho}} |Z^I \tilde{g}|$$

and

$$\begin{aligned}
|(\partial Z^I \phi)(\Psi(x)) - \partial Z^I \phi(x)| &\lesssim \left| \int_0^1 (x^{(2)} - x) \cdot \nabla \partial Z^I \phi(x + \tau(x^{(2)} - x)) d\tau \right| \\
&\lesssim \int_0^1 \varepsilon(1+s)^{\frac{1}{2}} |\bar{\partial}\partial Z^I \phi(x + \tau(x^{(2)} - x))| + \frac{\varepsilon(1+|q|)^{\frac{3}{2}+\sigma}}{(1+s)^{\frac{1}{2}}} |\partial^2 Z^I \phi(x + \tau(x^{(2)} - x))| d\tau \\
&\lesssim \frac{\varepsilon(1+|q|)^{\frac{1}{2}+\sigma}}{(1+s)^{\frac{1}{2}}} |\partial Z^{I+1}\phi(x + \tau(x^{(2)} - x))| d\tau.
\end{aligned}$$

Consequently, we have

$$\begin{aligned}
& \left\| Z^I \left(\int (\partial_q \phi^{(2)})^2 r dr - \int (\partial_q \phi)^2 r dr \right) \right\|_{L^2(\mathbb{S}^1)} \\
& \lesssim \int \frac{\varepsilon}{(1+|q|)^{\frac{3}{2}-4\rho}(1+s)^{\frac{1}{2}}} \frac{\varepsilon(1+|q|)^{\frac{1}{2}+\sigma}}{(1+s)^{\frac{1}{2}}} \|\partial Z^{I+1} \phi\|_{L^2(\mathbb{S}^1)} r dr \\
& + \int \frac{\varepsilon^2}{(1+s)(1+|q|)^{3-8\rho}} \|Z^I g_{LL}\|_{L^2(\mathbb{S}^1)} r dr + s.t. \\
& \lesssim \frac{\varepsilon}{(1+t)^{\frac{1}{2}}} \left(\|\partial Z^{I+1} \phi\|_{L^2} + \left\| w_2 \frac{g_{LL}}{1+|q|} \right\|_{L^2} \right) + s.t.
\end{aligned}$$

Consequently we have, for $I \leq N-4$

$$\left\| Z^I \left(\int (\partial_q \phi^{(2)})^2 r dr - \int (\partial_q \phi)^2 r dr \right) \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}}},$$

and

$$\left\| Z^{N-4} \left(\int (\partial_q \phi^{(2)})^2 r dr - \int (\partial_q \phi)^2 r dr \right) \right\|_{L^2(\mathbb{S}^1)} \lesssim \frac{\varepsilon^3}{(1+t)^{\frac{1}{2}-\rho}}.$$

A Global existence of solutions in the exterior

We denote by \bar{C} the complementary of the domain of dependence of $B(0, R+1)$. Let g_a be defined by Theorem 1.3. In generalized wave coordinates $\square_g x^\alpha = \square_{g_a} x^\alpha$ the system $R_{\mu\nu} = 0$ can be written, with the decomposition $g = g_a + \tilde{g}$

$$\square_g \tilde{g}_{\mu\nu} = P_{\mu\nu}(g)(\partial \tilde{g}, \partial \tilde{g}) + \tilde{P}_{\mu\nu}(\tilde{g}, g_a),$$

where we used the fact that g_a is Ricci flat. We perform a bootstrap argument : let T be such that we have a solution g of this equation on \bar{C}_T where \bar{C}_T is the restriction of \bar{C} to times less than T , and assume that

$$\|v^{\frac{1}{2}} \partial Z^N \tilde{g}\|_{L^2(\bar{C} \cap \Sigma_t)} \lesssim \varepsilon(1+t)^\rho, \tag{A.1}$$

$$\|v_1^{\frac{1}{2}} \partial Z^{N-2} \tilde{g}\|_{L^2(\bar{C} \cap \Sigma_t)} \lesssim \varepsilon. \tag{A.2}$$

where

$$\begin{aligned}
v(q) &= (1+|q|)^{2+2\delta'}, \\
v_1(q) &= (1+|q|)^{2+2\delta'-2\sigma}.
\end{aligned}$$

Thanks to Klainerman-Sobolev estimates (which are still valid in a region $\bar{C} \cap \Sigma_t$) we have

$$|\partial Z^{N-2} \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{3}{2}+\delta'}},$$

$$|\partial Z^{N-3} \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{3}{2}+\delta'-\sigma}},$$

$$|Z^{N-2} \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}-\rho}(1+|q|)^{\frac{1}{2}+\delta'}}, \tag{A.3}$$

$$|\partial Z^{N-3} \tilde{g}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{1}{2}}(1+|q|)^{\frac{1}{2}+\delta'-\sigma}}. \tag{A.4}$$

Thanks to the wave coordinate condition

$$|Z^{N-3}\tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}-\rho}(1+|q|)^{-\frac{1}{2}+\delta'}}, \quad (\text{A.5})$$

$$|\partial Z^{N-4}\tilde{g}_{\mathcal{T}\mathcal{T}}| \lesssim \frac{\varepsilon}{(1+s)^{\frac{3}{2}}(1+|q|)^{-\frac{1}{2}+\delta'-\sigma}}. \quad (\text{A.6})$$

To improve (A.1) we perform the energy estimate in the background metric, in the region \bar{C}_t . We obtain

$$\begin{aligned} & \int_{\Sigma_t} w Q_{\mathcal{T}\mathcal{T}} + \int_{\partial\bar{C}} w Q_{\mathcal{T}\mathcal{L}} + C \int_0^t \int w'(q) (\bar{\partial}\tilde{g})^2 \\ & \lesssim \int_0^t \frac{1}{1+\tau} \int Q_{\mathcal{T}\mathcal{T}} + \int_0^t \int |\partial_t Z^I \tilde{g}| |\square_g Z^I \tilde{g}| \end{aligned}$$

where \mathcal{L} is a null vector tangent to $\partial\bar{C}$ and Q is the energy momentum tensor for \square_g

$$Q_{\alpha\beta} = \partial_\alpha Z^I \tilde{g} \partial_\beta Z^I \tilde{g} - \frac{1}{2} g_{\alpha\beta} g^{\mu\nu} \partial_\mu Z^I \tilde{g} \partial_\nu Z^I \tilde{g}.$$

Consequently

$$Q_{\mathcal{T}\mathcal{L}} = T(Z^I \tilde{g}) \mathcal{L}(Z^I \tilde{g}) - \frac{1}{2} g_{\mathcal{T}\mathcal{L}} (L(Z^I \tilde{g}) L(Z^I \tilde{g}) + e_\theta(Z^I \phi)^2)$$

where L is null such that $g(L, \mathcal{L}) = -2$ and e_θ is tangent to \bar{C} and orthogonal to \mathcal{L} and L . We have

$$\begin{aligned} Q_{\mathcal{T}\mathcal{L}} &= \frac{1}{2} g_{\mathcal{T}\mathcal{L}} L(Z^I \tilde{g}) \mathcal{L}(Z^I \tilde{g}) + \frac{1}{2} g_{\mathcal{T}\mathcal{L}} \mathcal{L}(Z^I \tilde{g}) \mathcal{L}(Z^I \tilde{g}) + g_{\mathcal{T}e_\theta} \mathcal{L}(Z^I \tilde{g}) e_\theta(Z^I \tilde{g}) \\ &\quad - \frac{1}{2} g_{\mathcal{T}\mathcal{L}} (L(Z^I \tilde{g}) L(Z^I \tilde{g}) + e_\theta(Z^I \tilde{g})^2) \\ &= \frac{1}{2} g_{\mathcal{T}\mathcal{L}} \mathcal{L}(Z^I \tilde{g}) \mathcal{L}(Z^I \tilde{g}) - \frac{1}{2} g_{\mathcal{T}\mathcal{L}} e_\theta(Z^I \phi)^2 + g_{\mathcal{T}e_\theta} \mathcal{L}(Z^I \tilde{g}) e_\theta(Z^I \tilde{g}) \\ &\geq (1 - C\varepsilon) (\mathcal{L}(Z^I \tilde{g})^2 + e_\theta(Z^I \tilde{g})^2) \geq 0. \end{aligned}$$

Since in all our proof, the bootstrap condition (3.26) was not needed in the exterior region, we easily see from section 9.1 that we will be able to improve (A.1).

To improve (A.2) we perform the energy estimate in the flat metric. \tilde{Q} is now the flat energy-impulsion tensor. We now have to be careful with

$$\tilde{Q}_{\mathcal{T}\mathcal{L}} = \partial_t Z^I \tilde{g} \mathcal{L}(Z^I \tilde{g}) - \frac{1}{2} m_{\mathcal{T}\mathcal{L}} \left(\partial_s(Z^I \tilde{g}) \partial_q(Z^I \tilde{g}) + \frac{1}{r^2} (\partial_\theta Z^I \tilde{g})^2 \right),$$

which may not be positive. Since $\mathcal{L} = (1 + O(g - m))\partial_s + O(g_{LL})\partial_q + O(g_{UL})\partial_U$, we have

$$\begin{aligned} \tilde{Q}_{\mathcal{T}\mathcal{L}} &= (1 + O(\varepsilon)) \left((\partial_s Z^I \tilde{g})^2 + \frac{1}{r^2} (\partial_\theta Z^I \tilde{g})^2 \right) + O(g_{LL}) (\partial_q Z^I \tilde{g})^2 \\ &\geq (1 - \varepsilon) \left((\partial_s Z^I \tilde{g})^2 + \frac{1}{r^2} (\partial_\theta Z^I \tilde{g})^2 \right) - \frac{\varepsilon^3}{(1+s)^{\frac{5}{2}-3\rho}} \end{aligned}$$

where we have used (A.3). Consequently the energy estimate yields

$$\begin{aligned} & \int_{\Sigma_t} w (\partial Z^I \tilde{g})^2 + \int_{\partial\bar{C}} w (\bar{\partial} Z^I \tilde{g})^2 + C \int_0^t \int w'(q) (\bar{\partial}\tilde{g})^2 \\ & \lesssim \int_0^t \int |\partial_t Z^I \tilde{g}| |\square_g Z^I \tilde{g}| + \int_0^t \frac{\varepsilon^3}{(1+\tau)^{\frac{3}{2}-3\rho}} d\tau. \end{aligned}$$

We then easily see from Section 10.3 that we can improve the bootstrap assumption (we can check that the cubic non linearities without null structure in Q_{LL} are not present).

B Regularity of the initial data

To obtain solutions of the constraint equation with an asymptotic behaviour $g = g_b + \tilde{g}$, we take the exterior solution constructed in the previous section (we denote by s', q', θ' the coordinates used for this construction), make the change of variable

$$s' = (1 - \chi(r))s + \chi(r) \left((1 + b(\theta, s))s - (\partial_\theta b(\theta, s))^2 (1 + b(\theta, s))^{-1} q \right),$$

$$q' = (1 - \chi(r))q + \chi(r)(1 + b(\theta, s))^{-1}q,$$

$$\theta' = (1 - \chi(r))\theta + \chi(r) \left(\theta - \frac{q}{r} \frac{\partial_\theta b(\theta, s)}{(1 + b(\theta, s))^2} + f(\theta, s) \right),$$

and consider the space-like hypersurface, given by $t = 0$. We denote by Σ_b this hypersurface, and consider $\bar{g} = g|_{\Sigma_b}$, and K the second fundamental form of the embedding $\Sigma_b \subset M$. (\bar{g}, K) is a solution to the constraint equations.

Proposition B.1. *There exists*

$$(g_{\alpha\beta})_0, (g_{\alpha\beta})_1 \in H_\delta^{N+1} \times H_{\delta+1}^N$$

such that the initial data for g given by

$$g = g_b + g_0, \quad \partial_t g = \partial_t g_b + g_1,$$

are such that

- $\bar{g}_{ij} = g_{ij}, K_{ij} = \mathcal{L}_\beta g_{ij}$ satisfy the constraint equations (1.4) and (1.5).
- the following generalized wave coordinates condition is satisfied at $t = 0$

$$g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha = g_b^{\lambda\beta} (\Gamma_b)_{\lambda\beta}^\alpha + G^\alpha + \tilde{G}^\alpha,$$

where G^α is defined by (2.25), (2.26) and (2.27) and \tilde{G} is the sum of all the crossed term of the form $g_0 \frac{\partial_\theta}{r} g_b$ and $g_0 \partial_s g_b$ in $g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha - g_b^{\lambda\beta} (\Gamma_b)_{\lambda\beta}^\alpha$. Moreover we have the estimate

$$\|g_0\|_{H_\delta^{N+1}} + \|g_1\|_{H_{\delta+1}^N} \lesssim \varepsilon.$$

Proof. There are two issues to consider for the regularity of (\bar{g}, K) .

- We have $t' \sim t - b(\theta, s)r$, so $|t'| \rightarrow \infty$ as $r \rightarrow \infty$ in Σ_b . Consequently we have to be careful with the logarithmic growth in t' of the higher energy of \tilde{g} .
- In $\partial_\theta^N \tilde{g}$, we have terms of the form $\partial_\theta^{N+2} b(\theta, s) \partial_\theta \tilde{g}$: we have also to be careful with the logarithmic growth in s of $\|\partial_\theta^{N+2} b(\theta, s)\|_{L^2(\mathbb{S}^1)}$.

We treat the first issue. We can estimate $\int_{\Sigma_b} w(q) (\partial Z^N \tilde{g})^2 r dr d\theta$ by performing the energy estimate on the domain delimited by Σ_0 and Σ_b . We denote by Ω_b this domain. We have

$$\int_{\Sigma_b} w(q) (\partial Z^N \tilde{g})^2 \lesssim \int_{\Sigma_0} w(q) (\partial Z^N \tilde{g})^2 + \int_{\Omega_b} \frac{\varepsilon}{1+s} w(q) (\partial Z^N \tilde{g})^2.$$

We note that in the region $\Omega_b \cap \{q > R\}$ we have $|q| > Ct$. Since $w(q) \leq v(q)(1 + |q|)^{\delta - \delta'}$ we have

$$\begin{aligned} \int_{\Sigma_b} w(q)(\partial Z^N \tilde{g})^2 &\lesssim \int_{\Sigma_0} w(q)(\partial Z^N \tilde{g})^2 + \int_{\Omega_b} \frac{\varepsilon}{(1+t)^{1+\delta-\delta'}} v(q)(\partial Z^N \tilde{g})^2 \\ &\lesssim \int_{\Sigma_0} w(q)(\partial Z^N \tilde{g})^2 + \varepsilon^3. \end{aligned}$$

We treat the second issue with the help of the weight w :

$$\begin{aligned} \int w(r)(\partial^{N+2} b(\theta, s) \partial \partial_\theta \tilde{g})^2 &\lesssim \int \frac{\varepsilon}{(1+r)^{1+\delta-\delta'}} \|\partial_\theta^{N+2} b(\theta, r)\|_{L^2(\mathbb{S}^1)}^2 \\ &\lesssim \int \frac{\varepsilon^3}{(1+r)^{1+\delta-\delta'-2\rho}} \lesssim \varepsilon^3 \\ \int w(r)(\partial^{N+2} \partial_s b(\theta, s) \partial \partial_\theta \tilde{g})^2 &\lesssim \int \frac{\varepsilon}{(1+r)^{\delta-\delta'}} \|\partial_s \partial_\theta^{N+2} b(\theta, r)\|_{L^2(\mathbb{S}^1)}^2 dr \lesssim \varepsilon^3. \end{aligned}$$

We now discuss the regularity of $\partial_t g_{0i}$. The generalized wave coordinate condition writes

$$g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha = (g_b)^{\lambda\beta} (\Gamma_b)_{\lambda\beta}^\alpha + G^\alpha + \tilde{G}^\alpha,$$

Therefore, if we write it for $\alpha = i$ we obtain a relation for $\partial_t g_{0i}$ and if we write it for $\alpha = 0$, we obtain a relation for $\partial_t g_{00}$. However, if we write $g = g_b + \tilde{g}$, the term

$$g^{\lambda\beta} \Gamma_{\lambda\beta}^\alpha - (g_b)^{\lambda\beta} (\Gamma_b)_{\lambda\beta}^\alpha$$

contains crossed terms of the form

$$\tilde{g} \partial_U g_b \sim \tilde{g} \frac{\partial_\theta^3 b(\theta)}{r} + s.t., \quad \tilde{g} \partial_s g_b \sim \tilde{g} \partial_s^2 \partial_\theta b + s.t.$$

which do not belong in $H_{\delta+1}^N$ because we are missing a derivative on b . However these terms are removed thanks to the addition of the term \tilde{G} in the generalized wave coordinate condition. Consequently $\partial_t \tilde{g}_{00}$ and $\partial_t \tilde{g}_{0i}$ are given by a sum of terms the form

$$K, \nabla g_0, g_b K, g_b \nabla g_0, \frac{\chi(r) g_b}{r} g_0.$$

With this choice, $\partial_t \tilde{g}_{0i}$ and $\partial_t \tilde{g}_{00}$ belong to $H_{\delta+1}^N$. □

Acknowledgement This paper has benefit from the insight of many people. The author would like to thank in particular Jérémie Szeftel, Qian Wang, Spyros Alexakis, Mihalis Dafermos and Igor Rodnianski for the interesting conversations.
